**Revision History**

<b>Current:</b>	<b>Revision 1.2, 2025-01-02</b>
<b>Previous:</b>	<b>Revision 1.1, 2024-10-23</b>
<b>Page</b>	<b>Major changes since previous revision</b>
All	Changed all 0.95 V power supply values to 0.97 V.
<b>138</b>	<b>Section 6.3.1 Standard Auto-Negotiation Registers for MMD=0x07:</b> Corrected reset value of <b>EEE Link Partner Ability 2 (Register 7.63)</b> .
<b>149</b>	<b>Section 6.4.1 Vendor Specific 1 Device for MMD=0x1E:</b> Corrected reset value of <b>Data for Mailbox (Register 30.13)</b> .
<b>159</b>	<b>Table 26 Operating Range:</b> Updated $V_{LOW}$ power supply voltage range.
<b>160</b>	<b>Table 27 Typical Power Consumption:</b> Updated power consumption.
<b>160</b>	<b>Table 28 Maximum Power Consumption:</b> Updated power consumption.
<b>161</b>	<b>Table 29 Maximum Current Per Rail:</b> Updated current.
<b>172</b>	<b>Table 41 Electrical Characteristics for Supported Transformers (Magnetics):</b> Updated insertion loss in table.
<b>173</b>	<b>Table 42 Electrical Characteristics for Supported RJ45 Plugs:</b> Reverted the changes in table.
<b>Page</b>	<b>Major changes in Revision 1.1</b>
All	Changed all 0.9 V power supply values to 0.95 V.
<b>25</b>	<b>Table 11 Pin Strapping Configuration Description:</b> Corrected the <b>PS_RJ45_TAB</b> pin strapping by swapping the tab up and tab down settings.
<b>26</b>	<b>Section 3.2.1 MDIO Interface Voltage:</b> Added section <b>Section 3.2.1</b> .
<b>147</b>	<b>Section 6.4.1 Vendor Specific 1 Device for MMD=0x1E:</b> Updated description of <b>NRG_RST_CNT</b> in <b>NBASE-T Downshift Control Register (Register 30.10)</b> .
<b>148</b>	<b>Section 6.4.1 Vendor Specific 1 Device for MMD=0x1E:</b> Added <b>MDIO_VOL</b> in <b>Packet Manager Control (Register 30.12)</b> .
<b>157</b>	<b>Table 25 Absolute Maximum Ratings:</b> Updated $V_{LOW}$ power supply voltage range.
<b>159</b>	<b>Table 26 Operating Range:</b> Updated $V_{LOW}$ power supply voltage range.
<b>163</b>	<b>Table 32 Temperature Sensor Characteristics:</b> Updated minimum value of temperature range.
<b>166</b>	<b>Table 34 AC Characteristics of the Power Supply:</b> Updated $V_{LOW}$ power supply ripple.
<b>173</b>	<b>Table 42 Electrical Characteristics for Supported RJ45 Plugs:</b> Updated insertion loss in table.
<b>174</b>	<b>Table 44 JEDEC Thermal Resistance Package Parameter:</b> Updated table.

## Third-Party Trademark and Registered Trademark Declarations

ANSI <sup>®</sup>	ANSI, the ANSI logo, and numerous other identifiers containing ANSI are registered trademarks, service marks, and accreditation marks of the American National Standards Institute (ANSI).
Cisco <sup>®</sup>	Cisco is a registered trademark or trademark of Cisco Systems, Inc. and/or its affiliates in the United States and certain other countries. A list of other Cisco marks is available at <a href="https://www.cisco.com/c/en/us/about/legal/trademarks.html">https://www.cisco.com/c/en/us/about/legal/trademarks.html</a> .
IEEE <sup>®</sup>	IEEE, the IEEE logo, and other IEEE logos and titles are registered trademarks or service marks of The Institute of Electrical and Electronics Engineers, Incorporated.
IEEE 802.3 <sup>™</sup>	IEEE 802.3 is a trademark of The Institute of Electrical and Electronics Engineers, Incorporated.

## Preface

This Preliminary Data Sheet describes the features and system architecture of the Ethernet PHY MxL86211C, which is a Single Port 2.5G Ethernet PHY.

## Document Conventions

In the interest of brevity, this document uses short names to represent full product names.

**MxL86211C**                      Ethernet PHY MxL86211C

## Document Information

This document's identifying information is:

### Document Reference (Citation) Name

Ethernet PHY MxL86211C Preliminary Data Sheet Revision 1.2

### File Name

621151\_MxL86211C\_Prel\_DS\_Rev1.2.pdf

## Organization of this Document

- **Chapter 1, Product Overview**  
This chapter provides an overview of the MxL86211C.
- **Chapter 2, External Signals**  
This chapter provides a pinout of the MxL86211C device package.
- **Chapter 3, Functional Description**  
This chapter provides the functional description for the MxL86211C.
- **Chapter 4, MDIO and MMD Register Interface Description**  
This chapter describes the MDIO and MMD registers available to support the MxL86211C feature set.
- **Chapter 5, MDIO Registers Detailed Description**  
This chapter describes the fields and reset values of the MDIO registers.
- **Chapter 6, MMD Registers Detailed Description**  
This chapter describes the fields and reset values of the MMD registers.
- **Chapter 7, Electrical Characteristics**  
This chapter provides the electrical characteristics for the MxL86211C.
- **Chapter 8, Package Outline**  
This chapter provides a package outline and product ordering details for the MxL86211C.
- **Standards References**

## 1 Product Overview

The Ethernet PHY MxL86211C is a low power Ethernet PHY transceiver integrated circuit. It offers a cost-optimized solution that is well-suited for routers, switches, and home gateways. It performs the data transmission on an Ethernet twisted pair copper cable of category Cat5 or higher. MxL86211C supports the following data rates: 2500, 1000, 100, and 10 Mbit/s.

In terms of the Open System Interconnection (OSI) model, the MxL86211C implements a layer 1 physical media access device. It can be connected to another chip implementing a layer 2 MAC via a serial SGMII data interface.

On the Ethernet twisted pair interface, the MxL86211C is compliant with the following standards from IEEE 802.3 referenced in [1]: 2.5GBASE-T (IEEE 802.3 Clause 126, NBASE-T), 1000BASE-T (IEEE 802.3 Clause 40), 100BASE-TX (IEEE 802.3 Clause 25), and 10BASE-Te (IEEE 802.3 Clause 14). This interface supports the Energy-Efficient Ethernet feature to reduce idle mode power consumption. Power saving at the system level is also possible with the Wake-on-LAN feature. A low-EMI line driver with integrated termination facilitates the PCB design.

On the SGMII interface, connecting to another chip implementing a MAC layer, the MxL86211C supports the following standards: IEEE 802.3 Clause 36 and 27 [1], and Cisco SGMII [2]. This interface also operates at data rates: 2500, 1000, 100, and 10 Mbit/s.

The MxL86211C supports a standard MDIO management interface as defined in IEEE 802.3 Clause 22 and Clause 45 [1]. The MDIO serial interface can operate with a clock running up to 25 MHz. It allows a management entity (the external chip implementing the MAC) to access standard MDIO / MMD registers to control the MxL86211C behavior, or to read the link status. In addition, two vendor specific register banks (VSPEC1 and VSPEC2) allow MxL86211C specific configuration of LED, SGMII, and Wake-on-LAN features. The MDIO and MMD registers are documented in Chapter 5. The MxL86211C is also configurable via pin strapping.

The MxL86211C can drive up to three LEDs. Each LED is independently programmable to indicate the link speed, and traffic activities. Several indication schemes can be selected.

External supplies of both 3.3 V and 0.97 V are required.

The MxL86211C uses a single row package (type PG-VQFN-40, size 5 mm x 5 mm).

## 1.1 Features

This chapter provides an overview of the features supported by the MxL86211C:

### Communication Interfaces

- The multiple speed, single-port Ethernet PHY interface to the twisted pair cable supports:
  - Ethernet modes and standards: 2.5GBASE-T (IEEE 802.3, NBASE-T), 1000BASE-T (IEEE 802.3), 100BASE-TX (IEEE 802.3) and 10BASE-Te (IEEE 802.3)
  - Ethernet twisted pair copper cable of category CAT5 or higher
  - Low EMI voltage mode line driver with integrated termination resistors
  - Transformerless Ethernet for backplane applications
  - Auto-negotiation (ANEG) with extended next page support
  - Auto-MDIX and polarity correction
  - Auto-downspeed (ADS)
  - Energy-Efficient Ethernet (EEE) and power down mode
  - Wake-on-LAN (WoL)
- The SGMII SerDes interface supports:
  - 1000BASE-X IEEE 802.3 Clause 36 and 37 [1]
  - Cisco Serial-GMII Specification [2] operating at 1.25 Gbaud/s
  - Extension of 1000BASE-X and Cisco Serial-GMII to achieve 3.125 Gbaud/s by overclocking the SerDes to support the 2.5 Gbit/s data rate
  - Clock and Data Recovery (CDR)
- The management interface supports the communication between the Station Management (acronym “STA” per IEEE 802.3) and the MxL86211C using:
  - An MDIO slave interface that provides access to the standard registers in the MMD as described in IEEE 802.3 Clause 22 and Clause 45 [1] and listed in [Chapter 5](#)
  - An MDIO interface clock of up to 25 MHz
  - An MDIO interface with 1.8V and 3.3V levels are supported
  - 3 MDIO message frame types as described in IEEE 802.3: Clause 22, Clause 22 Extended, Clause 45 [1]
- The LED interface supports:
  - Up to 3 LEDs
  - Single color LEDs
  - Connection of LED to ground or 3.3 V
  - Several LED indication schemes (link/activity, link speed)
  - Configuration of LED indication via MDIO registers
  - Control of LED brightness via software driver API
  - Alternative configuration of LED pins as GPIO for custom indication
- Supports two external interrupts EXINT0 and EXINT1:
  - Configurable as input from, or output to an external controller

**Clocking Features**

- 25 MHz crystal operation
- Supports two general purpose clock pins GPC1 and GPC2 shared with GPIO

**Test Features**

- Cable diagnostics: cable open/short detection and cable length estimation
- UART

**Other Features**

- Temperature Sensor (warning, interrupt, reset and auto-downspeed)
- Dynamic Voltage Scaling
- FW upgrade over MDIO
- Low power mode to reduce the energy consumption when the Ethernet cable is unplugged, with automatic wake-up upon energy detection from cable

**Power Supply**

- 3.3 V power supply
- 0.97 V power supply

## 1.2 Block Diagram

Figure 2 shows the block diagram of the MxL86211C. The main interfaces are:

- Data interface to a MAC processor, using SGMII
- Slave control interface driven by a MAC processor, using MDIO slave
- Interrupt signal MDINT allowing the MxL86211C to notify the MAC processor about a change of status
- LED control
- Twisted pair interface

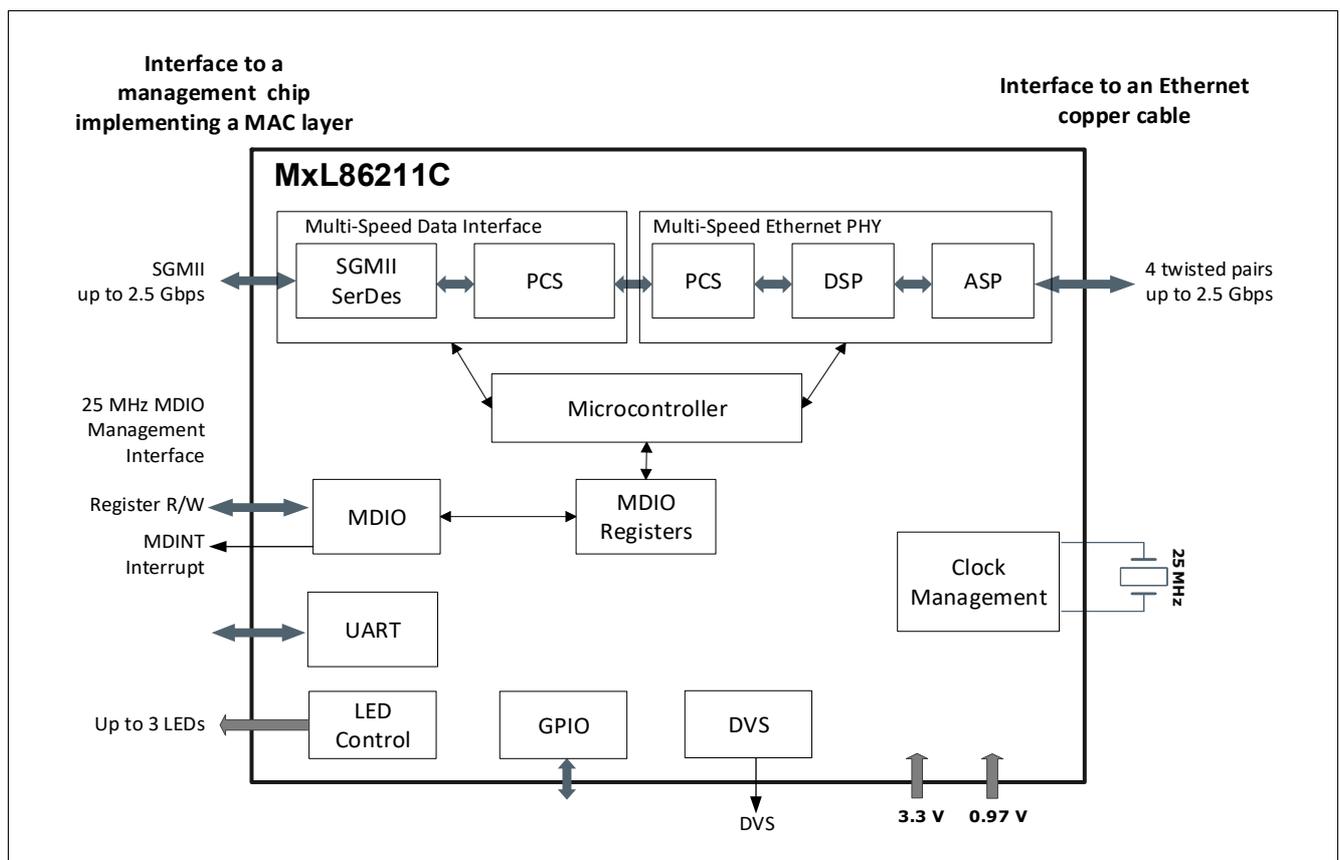

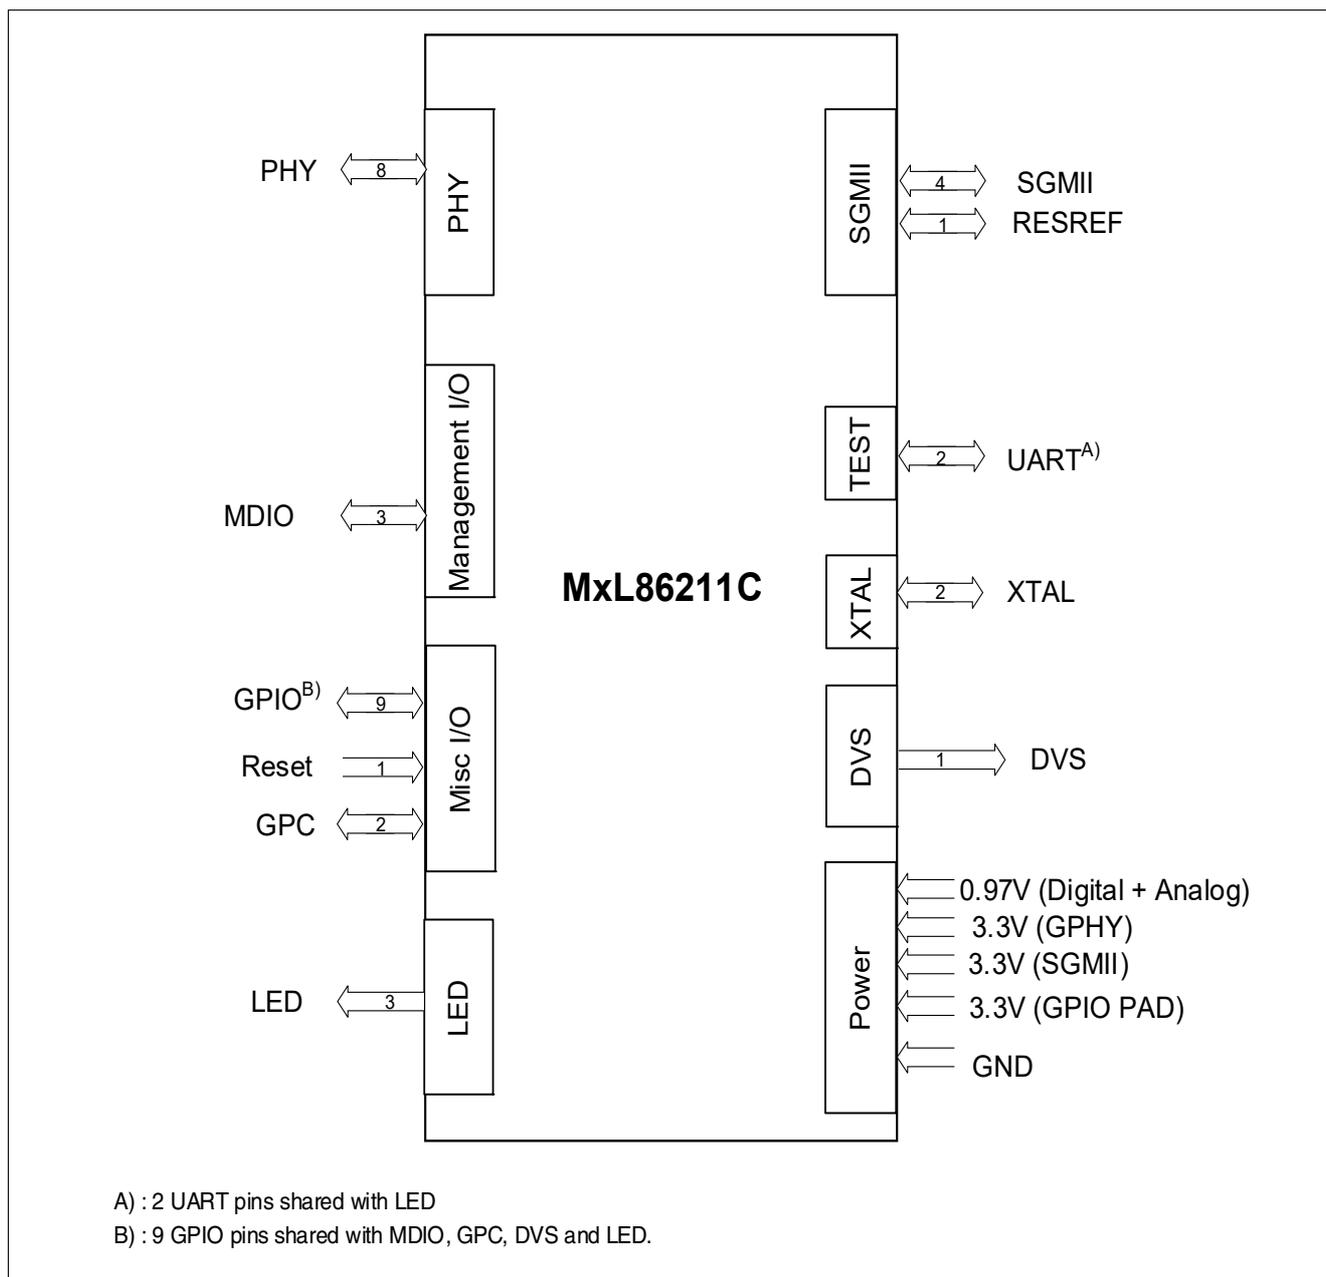

Figure 1 Ethernet PHY MxL86211C Block Diagram

## 2 External Signals

This chapter describes the signal mapping to the package.

### 2.1 Overview

**Figure 2** provides an overview of the external interfaces of the MxL86211C.

**Figure 2 Ethernet PHY MxL86211C External Signals Overview**

## 2.2 External Signal Description

This chapter provides the pin diagram, abbreviations for pin types and buffer types, as well as tables describing the input and output signals.

### 2.2.1 Pin Diagram

The pin layout of the package is shown in [Figure 3](#).

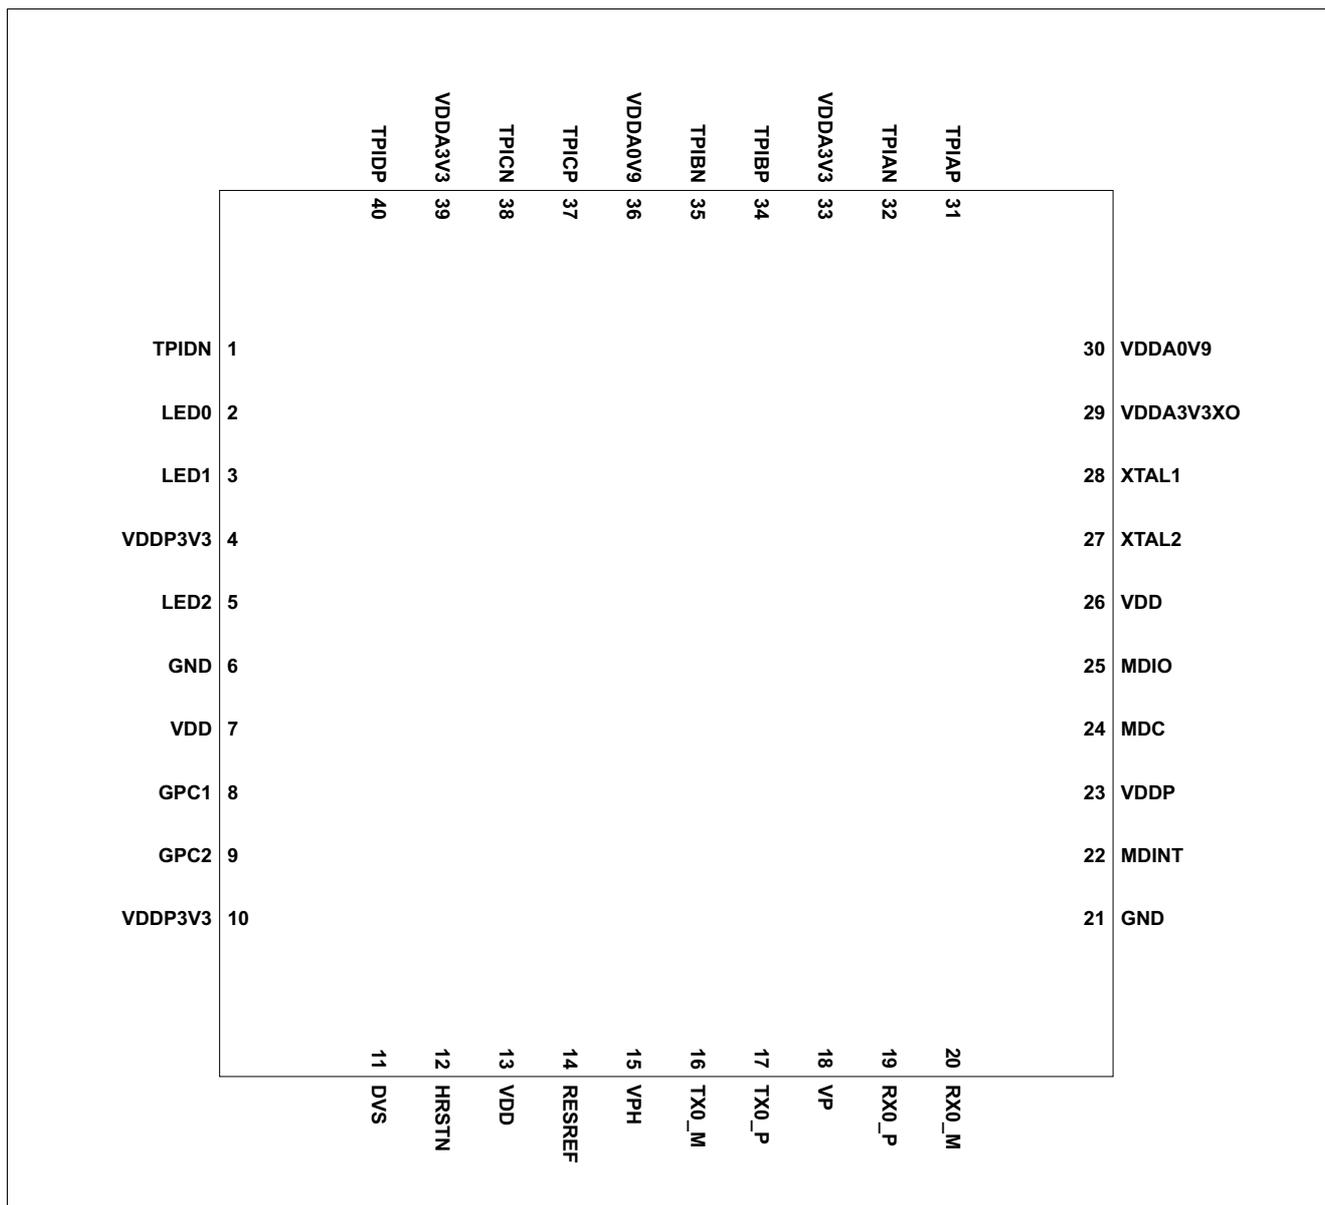

Figure 3 Pin Diagram for PG-VQFN-40 (Top View)

## 2.2.2 Abbreviations

Abbreviations that are used in the signal tables are summarized in [Table 1](#) and [Table 2](#).

**Table 1 Abbreviations for Pin Type**

Abbreviations	Description
I	Input only, digital levels
O	Output only, digital levels
I/O	Bidirectional input/output signal, digital levels
Prg	Bidirectional pad, programmable to operate either as input or output, digital levels
AI	Input only, analog levels
AO	Output only, analog levels
AI/AO	Bidirectional, analog levels
PWR	Power
GND	Ground

**Table 2 Abbreviations for Buffer Type**

Abbreviations	Description
A	Analog characteristics, see the AC/DC specification for more detail
Prg	Programmable (open-drain/push-pull, pull-up/pull-down characteristic are programmable)
PU	Pull up (internal, weak)

## 2.2.3 Input/Output Signals

A detailed description of all the pins is given in [Table 3](#) to [Table 8](#).

In [Table 5](#) to [Table 7](#), the signal names highlighted in **bold** are the same as the pin name and default use case. The signal names that are not in bold indicate alternate functions.

### 2.2.3.1 Ethernet PHY Twisted Pair Interface

### 2.2.3.2 SGMII Interface

**Table 4 SGMII Interface Signals**

Pin No.	Name	Pin Type	Buffer Type	Function
20	<b>RX0_M</b>	AI	A	<b>Differential SGMII Data Input Pair</b> These are the negative and positive signals respectively of the differential input pair of the SGMII SerDes interface. Due to the integrated CDR, no external transmission of source-synchronous clock is required for SGMII. These pins must be AC coupled.
19	<b>RX0_P</b>	AI	A	
17	<b>TX0_P</b>	AO	A	<b>Differential SGMII Data Output Pair</b> These are the negative and positive signals respectively of the differential output pair of the SGMII SerDes interface.
16	<b>TX0_M</b>	AO	A	
14	<b>RESREF</b>	AI/O	A	<b>Pad to Connect External Tuning Resistor</b>

### 2.2.3.3 LED/GPIO Interface

The LED interface allows external LEDs to be connected to indicate the status of the Ethernet PHY interfaces. Single color LEDs are supported.

**Table 5 LED Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
<b>LED Signals</b>				
2	<b>LED0</b>	O		<b>GPHY LED0</b> LED control output, freely configurable, drives single-color or dual color LEDs. Voltage Domain: 3.3V
	GPIO0	Prg	Prg	<b>General Purpose IO 0</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3V
3	<b>LED1</b>	O		<b>GPHY LED1</b> LED control output, freely configurable, drives single-color LEDs. Voltage Domain: 3.3V
	GPIO1	Prg	Prg	<b>General Purpose IO 1</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V
	FW_URXD	I		<b>Firmware UART Data Input</b> Firmware UART interface data input Voltage Domain: 3.3V
5	<b>LED2</b>	O		<b>GPHY LED2</b> LED control output, freely configurable, drives single-color LEDs. Voltage Domain: 3.3V
	GPIO2	Prg	Prg	<b>General Purpose IO 2</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V

### 2.2.3.4 Management Interfaces

MDIO management interface in accordance to IEEE 802.3 is provided.

**Table 6 Management Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
<b>MDIO Slave Interface</b>				
22	<b>MDINT</b>	O		<b>MDIO Interrupt</b> The MDINT signal is used to send an interrupt to an external MAC SoC acting as station manager (STA). The STA can program its sensitivity to specific events using the PHY_IMASK register. The MDINT event is then raised when the event occurs using the polarity programmed by pin strap. The STA can read which type of event occurred in the PHY_ISTAT register. Upon read of PHY_ISTAT by the STA, the MDINT is deasserted by the device. Voltage Domain: 1.8V / 3.3V
	GPIO3	Prg	Prg	<b>General Purpose IO 3</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 1.8V / 3.3V
	EXINT1	Prg	Prg	<b>External Interrupt 1</b> It can be selected as input or output mode. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 1.8V / 3.3V
24	<b>MDC</b>	I		<b>MDIO Slave Clock</b> The external controller host (also called "STA" in IEEE standard) acts as clock master and provides the serial clock of up to 25 MHz on this input. Voltage Domain: 1.8V / 3.3V
	GPIO4	Prg	Prg	<b>General Purpose IO 4</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 1.8V / 3.3V
25	<b>MDIO</b>	I/O		<b>MDIO Slave Data Input/Output</b> The external controller host (also called "STA" in IEEE standard) uses this signal to address internal registers and to transfer data to and from the internal registers. Voltage Domain: 1.8V / 3.3V
	GPIO5	Prg	Prg	<b>General Purpose IO 5</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 1.8V / 3.3V

### 2.2.3.5 Miscellaneous Signals

**Table 7 Miscellaneous Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
<b>Reset and Clocking</b>				
28	<b>XTAL1</b>	AI	A	<b>Crystal: Oscillator Input</b> A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must also tie both pins to GND.
	CLK	AI	A	<b>Crystal Oscillator: Clock Input</b> A clock must be connected to CLK. Clock details are provided in <a href="#">Table 35</a> .
27	<b>XTAL2</b>	AO	A	<b>Crystal: Oscillator Output</b> A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must also tie both pins to GND.
12	<b>HRSTN</b>	I	PU	<b>Hardware Reset</b> Asynchronous active low device reset Voltage Domain: 3.3V
11	<b>DVS</b>	O		<b>DVS Output</b> This is used to control the external power supply for dynamic voltage scaling Voltage Domain: 3.3V
	GPIO8	Prg	Prg	<b>General Purpose IO 8</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V
21	<b>GND</b>	I		<b>GND</b> This pin must be tied to Ground.
8	<b>GPC1</b>	Prg		<b>General Purpose Clock 1</b> General purpose clock. Either input or output mode can be selected. Voltage Domain: 3.3V
	GPIO6	Prg	Prg	<b>General Purpose IO 6</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V
	EXINT0	Prg	Prg	<b>External Interrupt 0</b> It can be selected as input or output mode. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V

**Table 7 Miscellaneous Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
9	GPC2	Prg		<b>General Purpose Clock 2</b> General purpose clock. Either input or output mode can be selected. Voltage Domain: 3.3V
	GPIO7	Prg	Prg	<b>General Purpose IO 7</b> Configurable as input or output. The output characteristic can be selected to be open drain or push-pull. Voltage Domain: 3.3V

### 2.2.3.6 Power Supply

This section specifies the power supply pins. They are categorized in 2 supply groups  $V_{HIGH}$  (3.3 V) and  $V_{LOW}$  (0.97 V).

**Table 8 Power Supply Pins**

Ball No.	Name	Pin Type	Buffer Type	Function
33, 39	VDDA3V3	PWR		<b>High Voltage Domain Supply <math>V_{HIGH}</math></b> These are the input power pins for the analog front end in the high voltage domain. They have to be supplied with a nominal voltage of 3.3 V.
30, 36	VDDA0V9	PWR		<b>Low Voltage Domain Supply <math>V_{LOW}</math></b> These are the input power supply pins for the low voltage domain. They supply mixed signal blocks in the analog front end and the clock distribution block of the Gigabit Ethernet PHY. These pins have to be supplied with a nominal voltage of 0.97 V.
29	VDDA3V3XO	PWR		<b>XO Pad Voltage Domain Supply <math>V_{HIGH}</math></b> This is the supply pin for the internal PLL and the internal crystal oscillator (XO). This pin has to be supplied with a nominal voltage of 3.3V.
18	VP	PWR		<b>SGMII Low Voltage Domain Supply <math>V_{LOW}</math></b> This is the pin for the low voltage domain of the SGMII interface. It supplies mixed signal blocks in the SGMII interface. This pin has to be supplied with a nominal voltage of 0.97 V.
15	VPH	PWR		<b>SGMII High Voltage Domain Supply <math>V_{HIGH}</math></b> This is the pin for the high voltage domain of the SGMII interface. It supplies mixed signal blocks in the PHY of the SGMII interface. This pin has to be supplied with a nominal voltage of 3.3 V.
23	VDDP	PWR		<b>Configurable MDIO Pad Voltage Domain Supply</b> This is the supply pin for the MDIO pad voltage, which is relevant for pin 22, pin 24 and pin 25. This group can operate with 1.8 V or 3.3 V. When operating with 1.8 V, this pin has to be supplied with a nominal voltage of 1.8 V. When operating with 3.3 V, this pin has to be supplied with a nominal voltage of 3.3 V.

**Table 8 Power Supply Pins (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
4, 10	VDDP3V3	PWR		<b>Pad Voltage Domain Supply <math>V_{HIGH}</math></b> This is the group of supply pins for the pad supply of GPIO pins (except the MDIO group of pin which is supplied by VDDP) This pin has to be supplied with a nominal voltage of 3.3 V.
7, 13, 26	VDD	PWR		<b>Core Voltage Domain Supply <math>V_{LOW}</math></b> This is the group of supply pins for the core digital voltage domain. These pins have to be supplied with a nominal voltage of 0.97 V.
6	GND	PWR		<b>Ground</b> This pin must be tied to Ground.

**Table 9 Device Ground**

Pin No.	Name	Pin Type	Buffer Type	Function
EPAD <sup>1)</sup>	VSS	GND		General Device Ground

1) The EPAD is the exposed pad on the bottom of the package. This pad must be properly connected to the ground plane of the PCB.

## 3 Functional Description

### 3.1 Power Supply, Clock and Reset

This chapter provides the information required to power up the MxL86211C.

#### 3.1.1 Power Supply

Two external power supplies of 3.3 V and 0.97 V are required.

#### 3.1.2 Clock Generation

An external 25 MHz crystal must be connected to the MxL86211C. The required crystal specification is documented in [Chapter 7.7.6](#). An internal PLL circuit generates all the required internal clocks.

#### 3.1.3 Reset Generation

The external hardware reset input (HRSTN pin) resets all the hardware modules:

- Driving the HRSTN pin low causes an asynchronous reset of the MxL86211C system.
- Releasing the HRSTN pin high triggers the power-on sequence and boot-up procedure.

The HRSTN pin is internally connected to a weak internal pull-up resistor.

#### 3.1.4 Power-On Sequence

The MxL86211C powers on when the power is applied as shown in [Figure 16](#) and [Figure 17](#). The following steps are executed at power on:

- Locking of internal PLL.
- Reading of pin strap information, as described in [Chapter 3.1.5](#).
- Booting of the microprocessor from internal ROM.
- Auto-negotiation on the Ethernet twisted pair interface and SGMII interface using the speed capability of 2.5 Gbit/s, full-duplex.
- Training and link up in accordance with the IEEE 802.3 [\[1\]](#) and SGMII [\[2\]](#) standards.

#### 3.1.5 Configuration by Pin Strapping

The MxL86211C device can be configured by means of pin strapping on a number of the GPIO pins. The pin strapping configurations are captured during the chip power-on sequence, until the reset initialization is complete.

The pin strap values can be set to logical high or low by connecting the corresponding pin via an external 1 kΩ resistor to either ground or 3.3 V.

The pin strap mapping is described in [Table 10](#) and [Table 11](#).

**Table 10 Pin Names used for Pin Strapping**

Pin Name	Pin Number	Configuration Item Description	Internal Pull-up/down
GPC1	8	PS_PHY_MADDR(0)	Pull-up
GPC2	9	PS_PHY_MADDR(1)	Pull-up
LED1	3	PS_PHY_MADDR(2) and PS_LED1_MODE	No
LED0	2	PS_SUPER_ISOLATE and PS_LED0_MODE	No
MDINT	22	PS_MDINT_POL	Pull-up
LED2	5	PS_RJ45_TAB and PS_LED2_MODE	No

**Table 11 Pin Strapping Configuration Description**

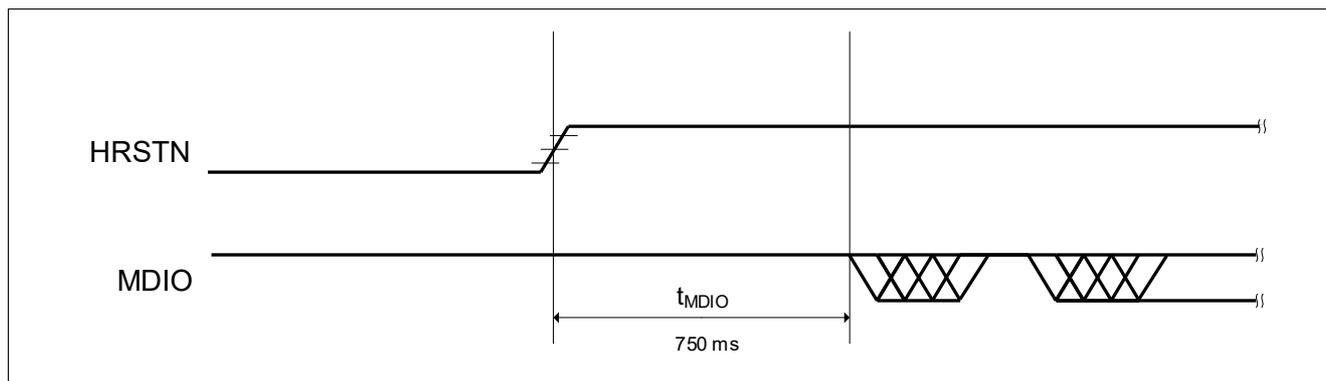

Pin Strapping Signals	Description
PS_PHY_MADDR(2:0)	<b>MDIO PHY Address</b> These values are used to specify the three least significant bits of the MDIO PHY Address. A high level means a logical 1 and low level means a logical 0. The two most significant bits of the 5-bit address are fixed at 0.
PS_MDINT_POL	<b>MDIO Interrupt (MDINT) Polarity</b> 0 <sub>B</sub> <b>HIGH</b> MDIO Interrupt (MDINT) is active high 1 <sub>B</sub> <b>LOW</b> MDIO Interrupt (MDINT) is active low
PS_LEDx_MODE	<b>LED Mode</b> This is to specify the LED mode per LED. PS_LED0_MODE follows the pin strapping setting of PS_SUPER_ISOLATE. PS_LED1_MODE follows the pin strapping setting of PS_PHY_MADDR(2). PS_LED2_MODE follows the pin strapping setting of PS_RJ45_TAB. 0 <sub>B</sub> <b>GROUND</b> Ground mode 1 <sub>B</sub> <b>POWER</b> Power mode
PS_RJ45_TAB	<b>RJ45 Pin Reversal</b> 0 <sub>B</sub> <b>DOWN</b> Tab down 1 <sub>B</sub> <b>UP</b> Tab up
PS_SUPER_ISOLATE	<b>Super Isolate</b> This is to specify whether the PHY is immediately active after a reset or it is halted until it is activated manually. 1 <sub>B</sub> <b>NORMAL</b> The PHY is active after reset 0 <sub>B</sub> <b>HALT</b> The PHY is inactive after reset

An alternative way to configure the MxL86211C after the boot process is to use the MDIO interface and write into various control registers, as detailed in [Chapter 3.2](#).

### 3.2 Configuration via MDIO Management Interface

The external controller (Station Management, STA) can be connected to the chip's slave MDIO interface. This allows access to the MDIO and MMD registers standardized in IEEE 802.3. Thus the STA can control chip configuration and retrieve status information. The MDIO transactions can be of any of the 3 types described in IEEE 802.3 Clause 22, Clause 22 Extended, and Clause 45 [1]. The list of MDIO registers is given in [Chapter 4](#).

[Figure 4](#) shows the minimum time required for the MDIO to be available for access.

**Figure 4 MDIO Access Timing**

#### 3.2.1 MDIO Interface Voltage

The MDIO interface supports a voltage level of 3.3 V or 1.8 V. A voltage level of 3.3 V is supported by default. To operate this interface at a voltage level of 1.8 V, complete this procedure:

1. Supply the [VDDP](#) pin with 1.8 V.
2. Wait for MDIO interface to be available after the minimum time required as shown in [Figure 4](#).
3. Write 1 to the [MDIO\\_VOL](#) bit of the [VSPEC1\\_PM\\_CTRL](#) register using the MDIO interface at a voltage level of 1.8 V.

After the configuration, both read and write operations are supported on the MDIO interface. See [Section 7.7.4](#) for the maximum MDIO clock frequency supported at 1.8 V voltage level.

### 3.3 Ethernet PHY Interface

The Ethernet PHY implements the physical layer of the Ethernet standard. It supports digital signal processing (DSP) and analog signal processing (ASP) functions, to transmit data over the twisted pair cable.

#### 3.3.1 Twisted Pair Interface

The Twisted Pair Interface (TPI) of the MxL86211C is fully compliant with IEEE 802.3. To facilitate low power implementation and reduce PCB costs, the series resistors required to terminate the twisted pair link with a nominal 100  $\Omega$  are integrated in the device.

As a consequence, the TPI pins can be connected directly via a transformer to the RJ45 plug. Additional external circuitry is required for common-mode termination and rejection. A schematic of the TPI circuitry taking these components into account is shown in [Figure 5](#). Refer to [Section 7.8.1](#) for details.

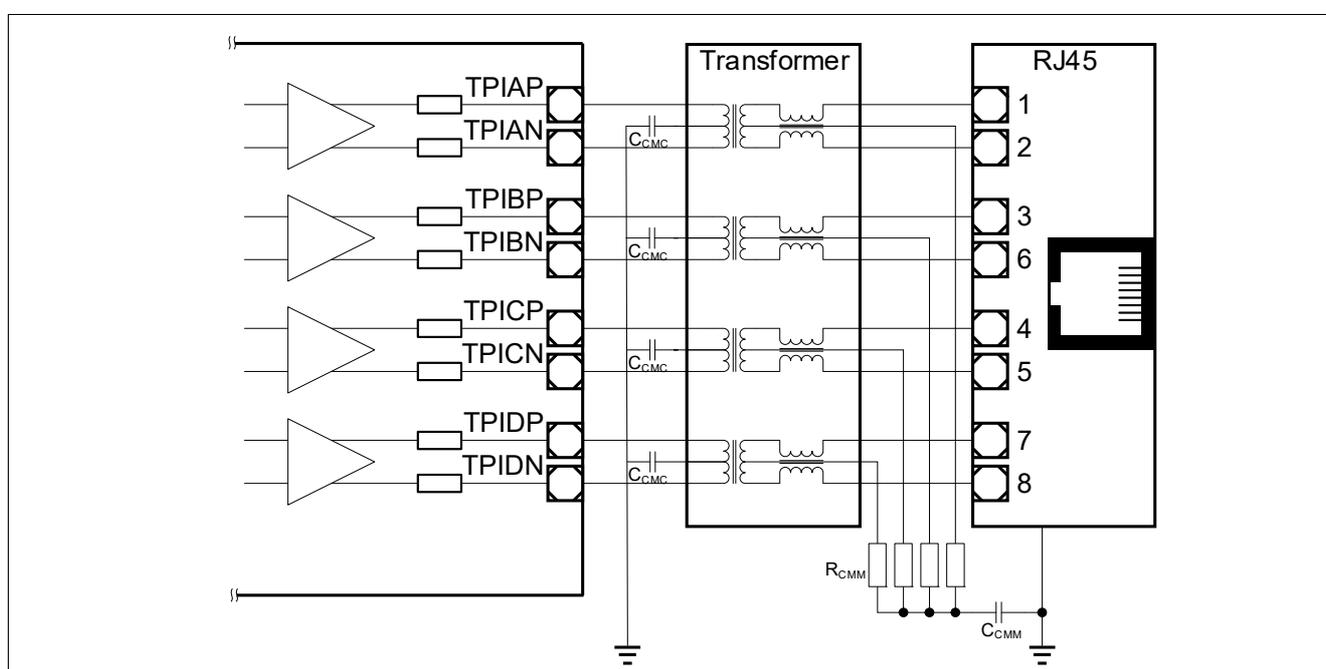

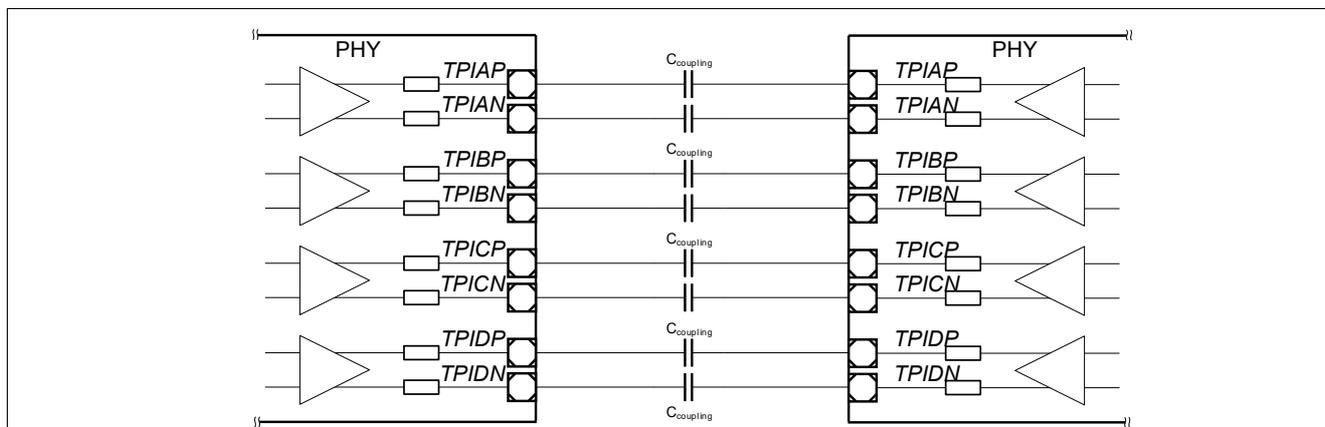

Figure 5 Twisted-Pair Interface of MxL86211C Including Transformer and RJ45 Plug

#### 3.3.2 Transformerless Ethernet

Transformerless Ethernet (TLE) is required for backplane applications where the use of a transformer is not necessarily required to fulfill the galvanic decoupling requirements of the isolation specifications. In such applications, removing the transformer reduces both the external bill of material and the space requirements on the PCB.

As the MxL86211C incorporates a voltage-mode line driver, the only stringent requirement is to use AC coupling. AC coupling can be achieved using simple SMD type series capacitors. The value of the capacitors is selected so that the high-pass characteristics correspond to an equivalent standard transformer based application (recommended  $C_{\text{coupling}} = 100 \text{ nF}$ ). [Figure 6](#) shows the external circuitry for TLE.

**Figure 6 External Circuitry for the Transformerless Ethernet Application**

### 3.3.3 Auto-negotiation

The MxL86211C supports auto-negotiation (ANEG) a part of the startup procedure to exchange capability information with the link partner. ANEG is enabled at MxL86211C initialization and its 2.5 Gbit/s speed capability is advertised.

The ANEG procedure is executed according to IEEE 802.3 Clause 28, Clause 40, and IEEE 802.3 Clause 126 [1].

If the link partner does not support ANEG, the MxL86211C extracts the link speed configuration using parallel detection as described in Clause 28.

A STA connected to the MDIO interface can reprogram the MxL86211C advertised capability if required. It can also disable ANEG, in which case the system configuration must ensure compatibility between link partners to link up in a compatible mode.

**Attention: *STD\_CTRL.DPLX takes effect only when the auto-negotiation process is disabled and the GPY TPI is not operating in loop-back mode, that is, bits STD\_CTRL.ANEN and STD\_CTRL.LB are set to zero. Forced Half Duplex mode (STD\_CTRL.DPLX = 0b0) is supported only in 10BT and 100BT speed modes. This field is ignored for higher speeds.***

### 3.3.4 Auto-downspeed

The auto-downspeed (ADS) feature implements a process to decrease the operating speed of the link when the link quality or cable is insufficient. The feature ensures maximum interoperability even in harsh or inadequate cable infrastructure environments. In particular, ADS is applied during the 2.5GBASE-T/1000BASE-T training phase. The downspeed is necessary when the cable quality or characteristics are inadequate. For example, it is possible to advertise 2.5GBASE-T/1000BASE-T during ANEG when both link partners are connected via a cable that does not support the 4-pair Gigabit Ethernet mode.

The MxL86211C detects such configurations to avoid repeating link up failures and clears Gigabit capability in the ANEG advertisement registers. After the resulting link down, the next ANEG procedure no longer advertises 1000BASE-T/2.5GBASE-T. The next link up is done at the next advertised speed below 1000 Mbit/s.

The MxL86211C also executes an ADS procedure when the signal quality is not suited to a 1000BASE-T/2.5GBASE-T link up due to increased alien noise or over long cables.

When the MxL86211C is configured to advertise no speed capability below 1000 Mbit/s, the ADS feature is disabled automatically.

### 3.3.5 Polarity Reversal Correction

For each of the 4 pairs, the MxL86211C automatically detects and corrects any inversion of the signal polarity on the P and N signals. The detection is done during the auto-negotiation phase. The detected polarity is frozen once the link has been established, and remains unchanged until the link is dropped.

The polarity corrections applied are indicated in the following register: PMA\_MGBT\_POLARITY (register 1.130) and are valid when auto-negotiation is complete.

### 3.3.6 Auto-Crossover Correction

To maximize interoperability, even in inadequate wiring environments, the MxL86211C automatically performs cable crossover (MDI-X). The supported pair-mappings detectable and correctable by the device are listed in [Table 12](#).

The purpose is to compensate for any non-standard (ANSI TIA/EIA-568-A:1995) cabling, as well as both straight-through and crossover cable connections: the MxL86211C automatically detects and corrects any crossed cable configuration (transmit-receive pairing between partners does not match). The auto-crossover function is fully compliant with IEEE 802.3, Clause 40.4.4 [1], in 1000BASE-T and 2500BASE-T mode.

The corrections applied are indicated in the following register: PMA\_MGBT\_POLARITY (register 1.130) and are valid when auto-negotiation is complete.

**Table 12 Supported Twisted Pair Mappings on a CAT5 or Better Cable**

Crossover Modes on RJ45 <sup>1)</sup>		RJ45 Pinning							
Mode	Description	1	2	3	4	5	6	7	8
11	Straight cable, standard compliant	TPIAP <b>(A+)</b>	TPIAN <b>(A-)</b>	TPIBP <b>(B+)</b>	TPICP <b>(C+)</b>	TPICN <b>(C-)</b>	TPIBN <b>(B-)</b>	TPIDP <b>(D+)</b>	TPIDN <b>(D-)</b>
00	Full Gigabit Ethernet MDI-X This is the standard compliant MDI-X with pair A-B swapped and pair C-D swapped	TPIBP <b>(B+)</b>	TPIBN <b>(B-)</b>	TPIAP <b>(A+)</b>	TPIDP <b>(D+)</b>	TPIDN <b>(D-)</b>	TPIAN <b>(A-)</b>	TPICP <b>(C+)</b>	TPICN <b>(C-)</b>

1) Pin assignment according to TIA/EIA-568-A/B

### 3.3.7 RJ45 Tab Up or Tab Down Configuration

The RJ45 plug on the system PCB can be soldered with the tab up or down as illustrated in [Figure 7](#).

The difference between tab up and tab down is a swap in position between A and D. The pin strap PS\_RJ45\_TAB allows the system designer to perform this configuration. As a result, a PCB layout does not need to be modified when a RJ45 tab up or down socket needs to be mounted.

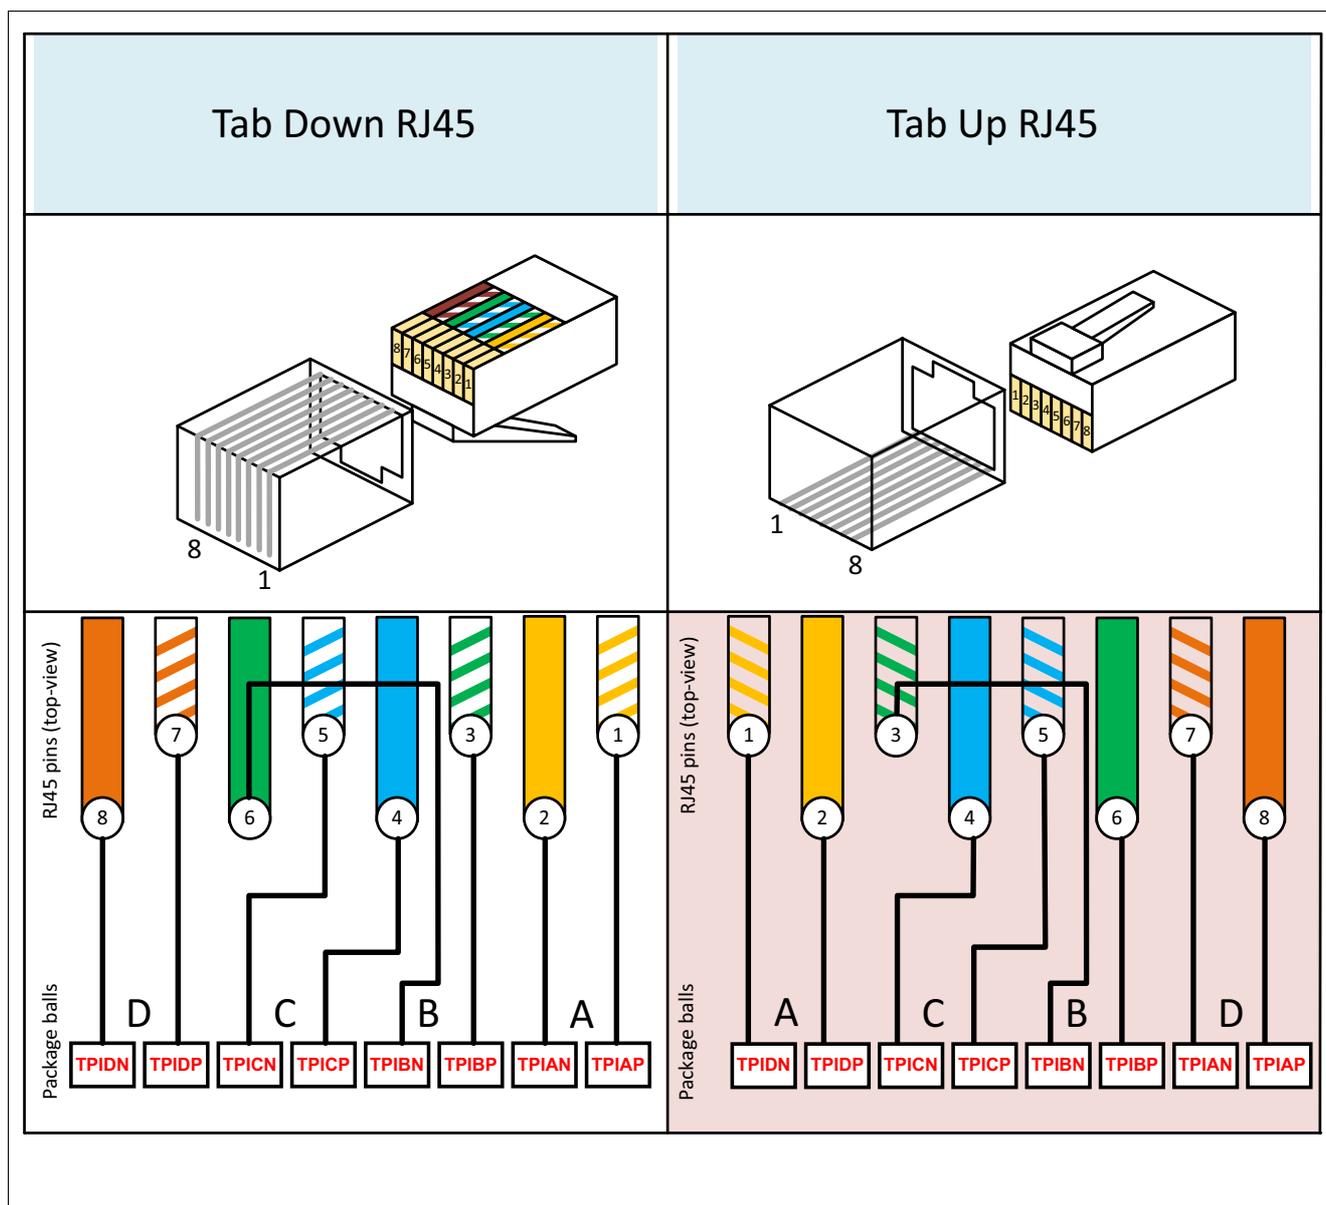

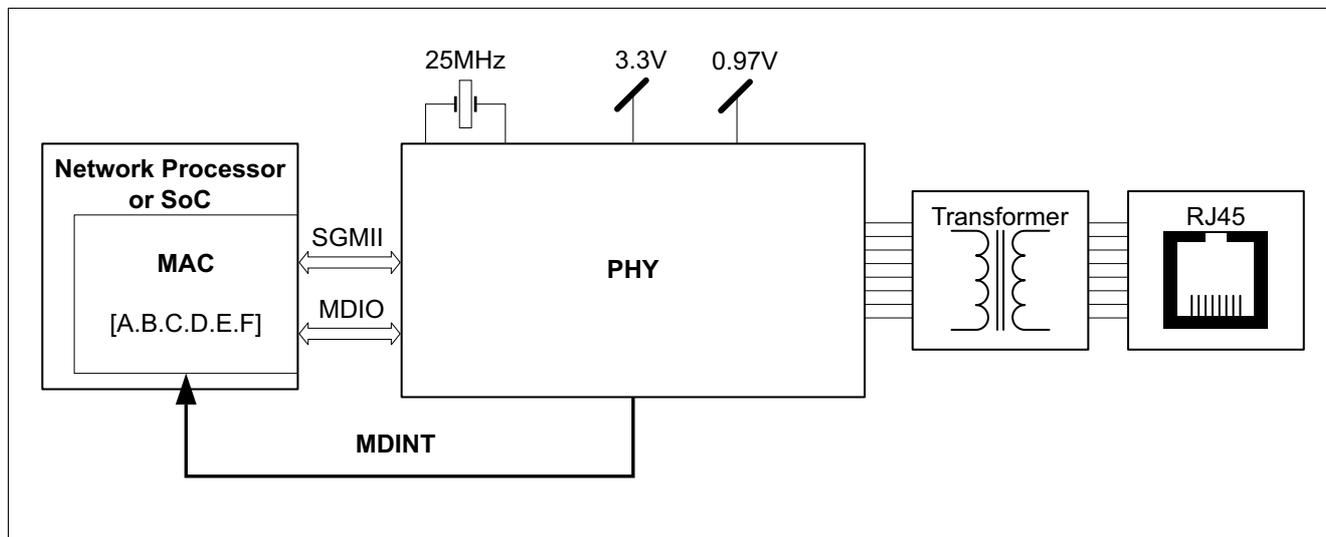

Figure 7 RJ45 Tab Up or Tab Down Configuration

### 3.3.8 Wake-on-LAN

The MxL86211C supports Wake-on-LAN. It generates an interrupt to an external controller when it detects special WoL Ethernet packets. This allows the controller to enter sleep mode if there is no Ethernet traffic to process, and be woken up when traffic starts. WoL packets are detected for all link speeds. This scenario is shown in [Figure 8](#).

**Figure 8** Block Diagram of WoL Application

The most commonly used WoL packet is called a magic packet. A magic packet contains the MAC address of the device to be woken up as well as, optionally, a password called SecureON. The MAC address and the optional SecureON password relevant for the WoL logic inside the MxL86211C can be configured in the WOL MDIO registers in “Vendor Specific 2” VSPEC2 MMD device described in [Chapter 4](#). When such a configured magic packet is received by the MxL86211C, an MDINT interrupt is issued.

An example programming sequence for these configuration registers is given in [Table 13](#).

**Table 13** Programming Sequence for the Wake-on-LAN Functionality

Step	Register Access	Remark
1	MDIO.MMD.WOLAD01 = EEFF <sub>H</sub>	Program the fifth and sixth MAC address bytes
2	MDIO.MMD.WOLAD23 = CCDD <sub>H</sub>	Program the third and fourth MAC address bytes
3	MDIO.MMD.WOLAD45 = AAB <sub>H</sub>	Program the first and second MAC address bytes
4	MDIO.MMD.WOLPW01 = 4455 <sub>H</sub>	Program the fifth and sixth SecureON password bytes
5	MDIO.MMD.WOLPW23 = 2233 <sub>H</sub>	Program the third and fourth SecureON password bytes
6	MDIO.MMD.WOLPW45 = 0011 <sub>H</sub>	Program the first and second SecureON password bytes
7	MDIO.PHY.IMASK.WOL = 1 <sub>B</sub>	Enable the Wake-on-LAN interrupt mask
8	MDIO.MMD.WOLCTRL.WOL.EN = 1 <sub>B</sub>	Enable Wake-on-LAN functionality

### 3.4 SGMII Interface

The MxL86211C implements a serial data interface, called SGMII or SerDes, to connect to another chip implementing the MAC layer (MAC SoC). The data rates supported by the SGMII interface are the same as for the TPI (10 Mbit/s, 100 Mbit/s, 1 Gbit/s, or 2.5 Gbit/s). These rates correspond to baud rates of 1.25 Gbaud (for 10/100/1000 Mbit/s using data repetition), and 3.125 Gbaud (for 2.5 Gbit/s).

#### 3.4.1 SGMII Control and Status Registers

The MxL86211C API describing the driver software executed on the MAC SoC must be followed to configure the SGMII interface.

The MAC SoC can use MDIO registers to retrieve the MxL86211C TPI and SGMII status.

The API controls the SGMII interface using 2 MDIO registers described, as shown in [Figure 9](#):

- VSPEC1\_SGMII\_CTRL is used to enable and configure the SGMII auto-negotiation or force a link configuration. Programming this register is optional as the SGMII interface comes up in a default configuration after reset that does not need any additional control from the STA. The STA can also control the SGMII reset, SGMII powerdown or SGMII loop back using this register. Until SGMII is in powerdown (VSPEC1\_SGMII\_CTRL.PD = 1) state, programming to other bits on VSPEC1\_SGMII\_CTRL register is ignored.
- VSPEC1\_SGMII\_STAT is a read-only register that can be used by the STA to retrieve the SGMII link status, data rate and auto-negotiation completion status.

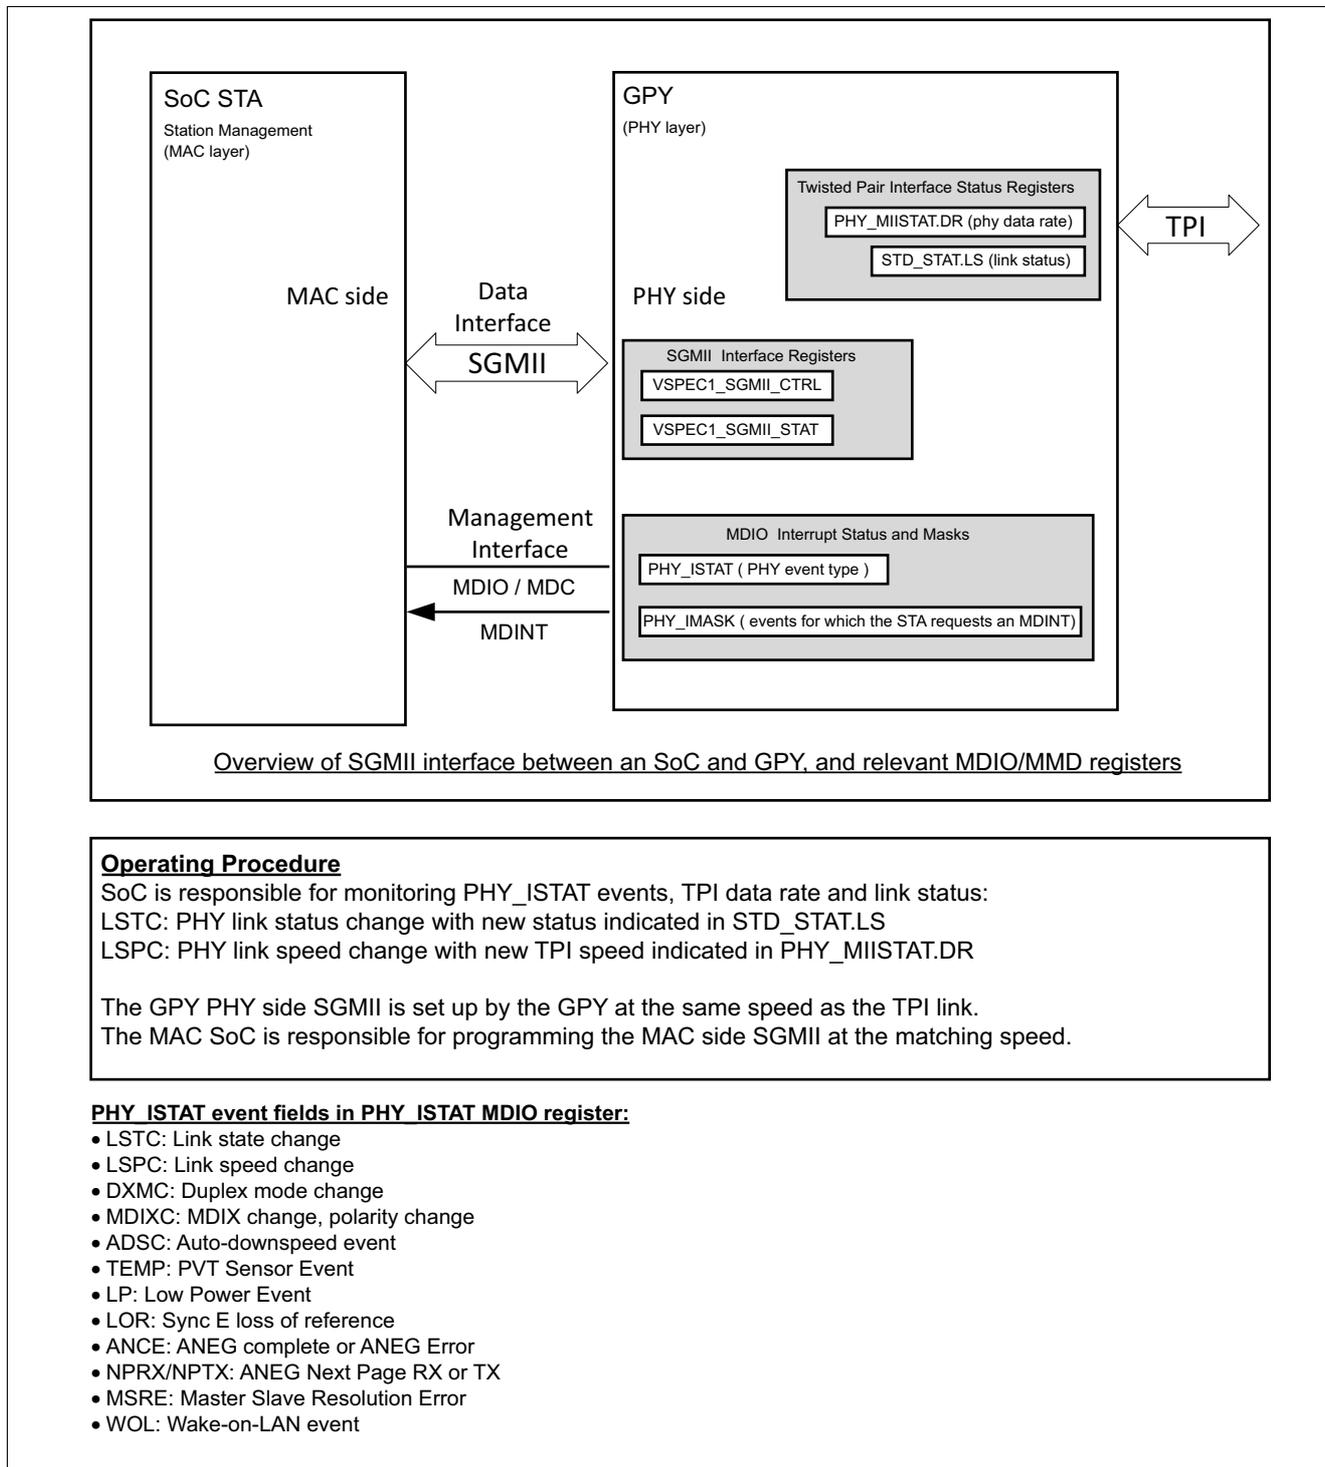

Figure 9 MxL86211C SGMII Configuration and Status Registers

### 3.4.2 SGMII Configuration at Power Up

The MxL86211C SGMII interface is configured to operate automatically after reset. The STA does not have to change the register VSPEC1\_SGMII\_CTRL to operate in this default mode:

- SGMII auto-negotiation is enabled
- The TPI configuration after link up defines the SGMII PHY side configuration. The MAC side SoC must configure its SGMII MAC side interface to match the MxL86211C PHY side configuration, as explained in [Chapter 3.4.3](#), [Chapter 3.4.4](#), and [Chapter 3.4.5](#)

### 3.4.3 SGMII PHY Side Setup According to TPI Setup

The MxL86211C PHY side SGMII is set up by the MxL86211C at the same speed as the twisted pair interface (TPI) link. To operate the MxL86211C in this mode VSPEC1\_SGMII\_CTRL.FIXED2G5 must be programmed to 0 (default value is 0). This is the default mode.

When a link status changes on the TPI (up/down and speed change), the MxL86211C reconfigures its SGMII automatically. In particular, the SGMII clock is changed when the speed changes from 2500 Mbit/s to lower speeds, or vice-versa.

### 3.4.4 SGMII PHY Side Setup Fixed 2.5G Mode Irrespective of TPI Setup

The MxL86211C PHY side SGMII is fixed to 2.5G mode irrespective of the twisted pair interface (TPI) link. To operate the MxL86211C in this mode VSPEC1\_SGMII\_CTRL.FIXED2G5 must be programmed to 1 (default value is 0).

When MxL86211C intends to operate in this mode, recommendation is to switch to this mode by programming VSPEC1\_SGMII\_CTRL.FIXED2G5 to 1 when the MDIO interface is available after the power-up. When a link status changes on the TPI (up/down and speed change), the SGMII on MxL86211C will be operating on 2.5G speed. To alleviate the packet drops due to rate mismatch on SGMII and TPI link, the host MAC must enable flow control to detect and react to the PAUSE frames generated by PHY. In this mode, an internal buffer path is enabled and hence there will be latency introduced in this mode of operation.

### 3.4.5 SGMII MAC Side Setup by MAC SoC

The MAC SoC (STA) is responsible for monitoring the PHY\_STAT events, which indicate TPI data rate and link status. The MAC SoC can monitor link status or link speed changes using the following three possible methods:

- Using the MDIO interface MDINT interrupt and reading the associated event
- Using the MDIO interface polling (reading) of the link status register STD\_STAT.LS
- Using the restart of the SGMII ANEG which conveys the new link parameters. In this case, the SGMII Cisco ANEG must be enabled after power up.

In all three cases:

- The MxL86211C reconfigures the PHY side SGMII to match the TPI setup
- The MAC SoC must set up the MAC side SGMII to match the PHY side SGMII

### 3.4.6 SGMII Link Monitoring by MAC SoC

The MxL86211C indicates its interface status using the following registers, as indicated in [Figure 9](#):

- MDIO register PHY\_MIISTAT to indicate the TPI status
- MDIO register SGMII\_STAT to indicate the SGMII status

A change of status on the TPI can be indicated by the MDIO interrupt MDINT. MDINT is generated if the STA has programmed the event mask in the PHY\_IMASK register corresponding to any of the following events occurring on the TPI:

- LSTC: Link state change
- LSPC: Link speed change
- DXMC: Duplex mode change
- MDIXC: MDIX change, polarity
- ADSC: Auto-downspeed event
- TEMP: PVT Sensor Event
- LP: Low Power Event
- LOR: Sync E loss of reference
- ANCE: ANEG complete or ANEG error
- NPRX/NPTX: ANEG next page RX or TX
- MSRE: Master Slave Resolution Error
- WOL: Wake-on-LAN

The MDINT signal is deasserted by the MxL86211C when the MAC SoC STA performs a READ access to the MDIO register PHY\_ISTAT.

The events relevant to the TPI status that are useful for monitoring SGMII are LSTC and LSPC.

#### 3.4.6.1 Actions on TPI Link Down / Link Up Status Change

The MxL86211C does not systematically bring the SGMII link down when the TPI link is down.

The STA can read the status on each side (SGMII and TPI) and make the appropriate decision about the SGMII link down.

For example, if the TPI status is in link down for too long, the STA can take the decision to also power down the SGMII.

#### 3.4.6.2 New TPI Link Up at Same Speed

The following scenario describes a transition on TPI that does not require any restart or change of mode on SGMII:

- SGMII is set to a specific speed and SGMII link is up
- TPI goes to link down – and link up
- When TPI is down, the SGMII side is transmitting Idle packets
- TPI links up at the same speed as before

In these cases, the MxL86211C does not reprogram the PHY side SGMII.

#### 3.4.6.3 Change of Speed After a New Link Up on TPI

The following scenario describes a transition on TPI that requires a change of mode on SGMII:

As a PHY side SGMII controller, the MxL86211C enforces the speed on the MAC side SGMII.

For a change in TPI speed within the [10/100/1000 Mbit/s] rate subset, there is no change in baud speed on SGMII:

- New TPI configuration is reflected in the MDIO status registers and the MDINT interrupt is triggered to indicate the change as explained in [Chapter 3.4.6](#).
- MxL86211C programs its SGMII to the new speed. In particular, for speeds 10 and 100 Mbit/s, the MxL86211C SGMII PCS performs data repetition by 100x and 10 x respectively.

---

**Functional Description**

- SGMII lane clock remains unchanged at 1.25 Gbaud clock speed.
- If Cisco ANEG is enabled, the MxL86211C conveys the changed speed parameters by restarting SGMII ANEG.
- If Cisco ANEG is disabled, the MxL86211C changes the SGMII configuration immediately and expects the MAC SoC to monitor the link change and match the same configuration.

For a change in data speed from the SGMII subset [10/100/1000 Mbit/s] to SGMII subset [2500 Mbit/s], there is a need to change the SGMII lane baud speed to the over clocked 3.125 Gbaud:

- New TPI configuration is reflected in the MDIO status registers and the MDINT interrupt is triggered to indicate the change as explained in [Chapter 3.4.6](#).
- MxL86211C reprograms its SGMII to the 3.125 Gbaud clock speed.
- If Cisco ANEG is enabled, the MxL86211C conveys the changed speed parameters by restarting SGMII ANEG.
- If Cisco ANEG is disabled, the MxL86211C changes the SGMII configuration immediately and expects the MAC SoC to monitor the link change and match the same configuration.
- The MAC SoC reconfigure its MAC side SGMII to the new baud rate.

### 3.4.7 Auto-negotiation Modes Supported by SGMII

Two modes are supported for the SGMII auto-negotiation protocol:

- Cisco Serial-GMII Specification 1.8 [2]
- 1000BX IEEE 802.3 following IEEE Clause 37 [1]

The information exchange mechanism of ANEG is the same in both modes, but the parameters communicated are slightly different. The 1000BX scheme allows for some parameters to be aligned with the highest common capability between the two sides of the SerDes. The Cisco SGMII scheme uses the protocol to communicate the configuration requested by the PHY side SGMII to the MAC side SGMII (e.g. speed request); it is a one-way request.

The parameters communicated by the Cisco ANEG protocol [2] from SGMII-PHY to SGMII-MAC are:

- Link Up or Link Down indication (reflects the TPI status)
- Half Duplex or Full Duplex mode
- Data rate (standard only supports 10 Mbit/s to 1000 Mbit/s)
- EEE capability support
- EEE Clock Stop capability support

The parameters exchanged by the 1000BX ANEG protocol [1] are:

- Remote fault
- Pause support and mode (symmetrical or asymmetrical)
- Half Duplex or Full Duplex

The Cisco ANEG protocol is recommended for a standard application.

#### 3.4.7.1 Enabling SGMII Auto-negotiation Mode

SGMII auto-negotiation is ON at power up. ANEG can be enabled/disabled by setting register field VSPEC1\_SGMII\_CTRL.ANEN. In the default case:

- MxL86211C PHY side SGMII is configured by MxL86211C to match the TPI link configuration.
- MxL86211C uses ANEG to convey the new link parameters to the MAC SoC.
- MAC SoC MAC side SGMII must be configured by the MAC SoC to match the MxL86211C PHY side SGMII configuration.

### 3.5 LED Interface

#### 3.5.1 LED

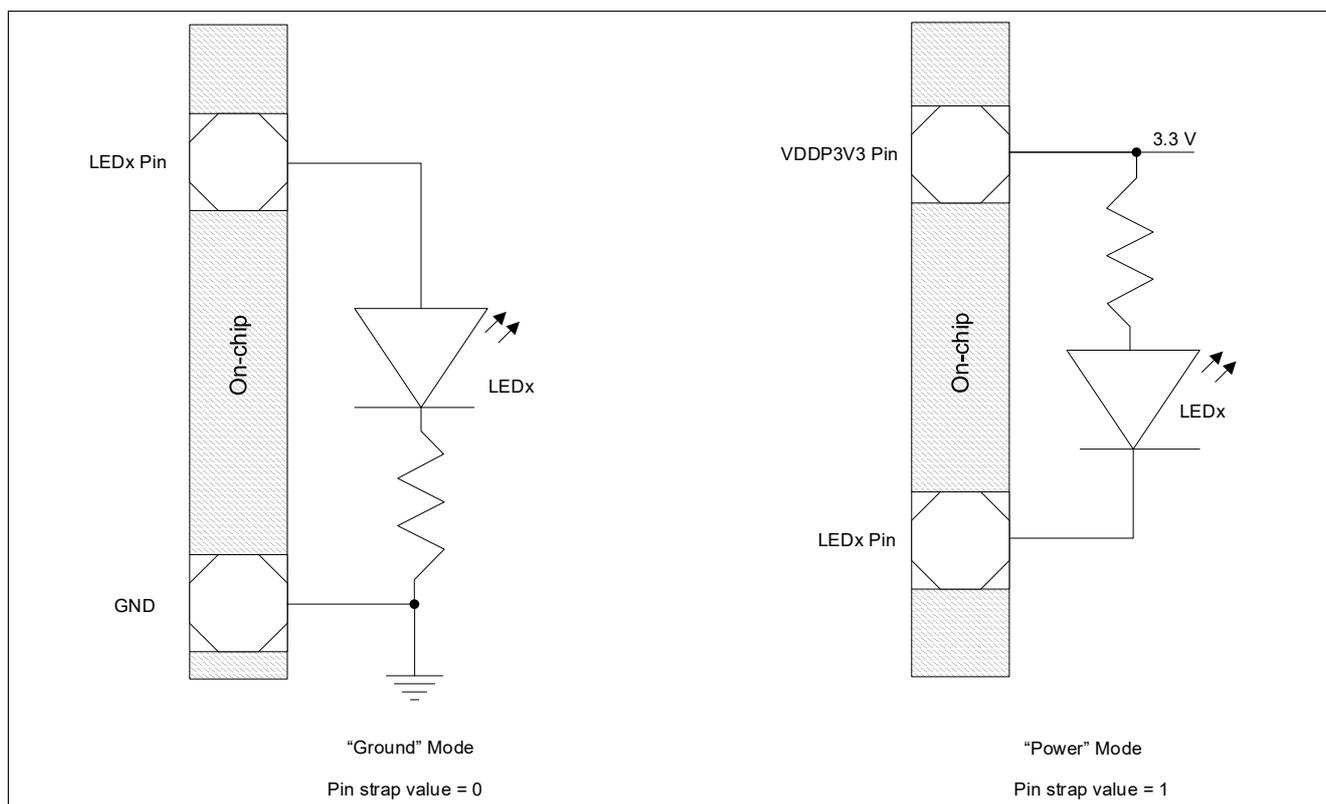

The MxL86211C allows 3 LEDs to be used for visual status indication. Each pin can drive a single color LED.

#### 3.5.2 LED Configuration

The MxL86211C API describing the driver software executed on the MAC SoC must be followed to configure this interface.

The external LED can be connected to either the ground or to power as shown in [Figure 10](#). The LEDx pin represents one of the available LED interface pins at the device. The GND signal represents the common ground EPAD. The pin strap value of the LEDx pin depends on the mode of the LED, as shown in [Figure 10](#).

*Note: This figure does not show the full recommended circuits with all the necessary components. Refer to the relevant HDK/EVK PCB design documentation for more details.*

**Figure 10 LED Connection Options to Ground or Power Supply**

### 3.5.3 LED Brightness Control

There are two LED brightness modes configurable by the GPY API, based on the system requirement.

- LED Brightness Level Max Mode  
Fixed level signal (no pulses) for maximum brightness which can also be used as control signal for other purposes.
- LED Brightness Level Control Mode (Constant Mode)  
Allows the configuration of 16 levels of LED brightness as described in [Brightness Control](#).

#### Brightness Control

This block controls the brightness of the LED by way of controlling the time duration the LED is ON/OFF, and due to persistence of the eye, LED brightness will be perceived. When LED is off, the output is disabled. When LED is on, the output is enabled. Brightness control controls the LED output enable directly.

As show in [Figure 11](#), brightness control frequency is 81.25 Hz. Each period is divided into 64 slots.

When LED brightness control is disabled, LED is enabled in all 64 slots.

When LED brightness control is enabled, LED is enabled for consecutive n slots. n is determined by brightness level configured. LED output is disabled in the 64th slot.

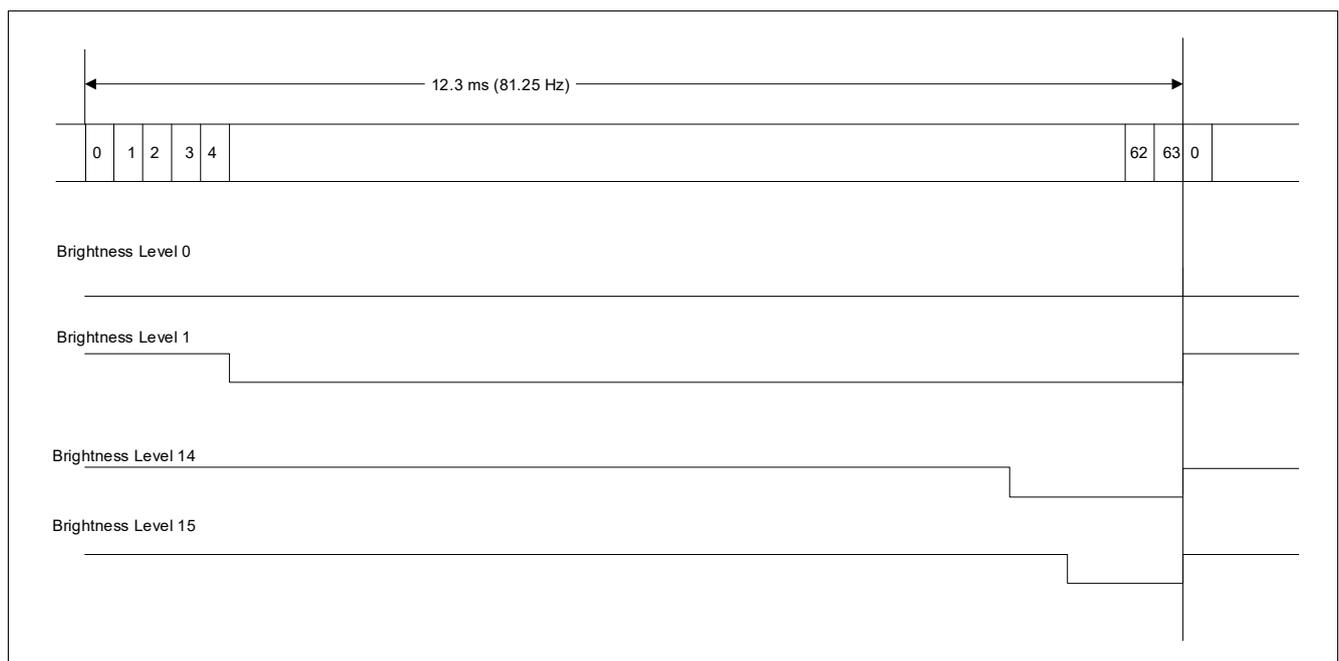

Figure 11 LED Brightness Control By Controlling LED Output Enable/Disable

### 3.6 Smart-AZ Feature

The Smart-AZ feature is relevant when the MxL86211C is connected to a MAC SoC that does not implement the EEE feature in its MAC layer. In this case, the MAC SoC cannot initiate a transition to the low-power idle state.

To alleviate the limitation of such a MAC SoC, the MxL86211C detects the conditions that may lead to low-power idle and generates the control messages to enter EEE mode in accordance with the IEEE 802.3az standard.

The Smart-AZ feature is enabled by default. It can be disabled by programming VSPEC1\_PM\_CTRL.PM\_EN to 0.

### 3.7 Power Management

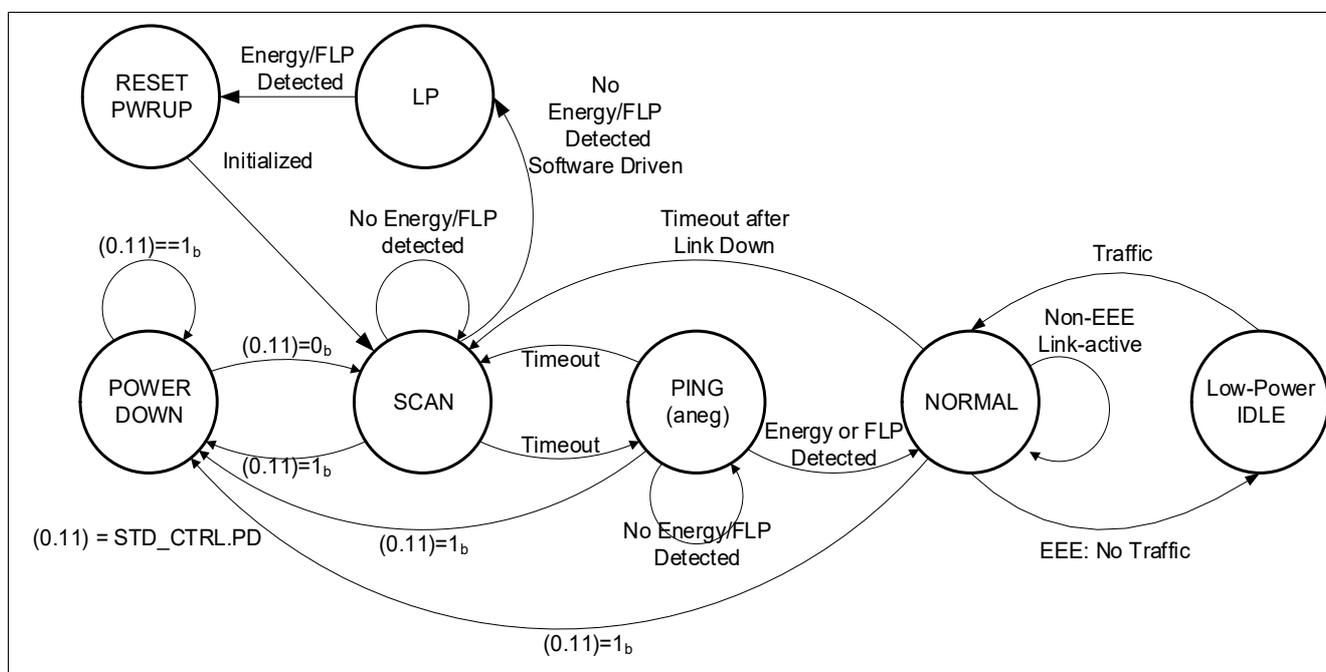

This chapter describes the power management functions of the MxL86211C.

#### 3.7.1 Power States

**Figure 12** illustrates the power states and transition of the MxL86211C. In this state diagram, the (0.11) syntax corresponds to the value of bit 11 from register 0 in device 0. This is the “PD” power down bit in MDIO STD\_CTRL described in **Chapter 4**. The station management can use this STD\_CTRL.PD field to bring the physical interface to POWER DOWN state.

The other states are automatically entered by the MxL86211C depending on the context, and following the Energy Efficient Ethernet protocol. This is done without need for any intervention from STA.

Acronyms “NLP” and “FLP” respectively mean “Normal Link Pulse” and “Fast Link Pulse”. These pulses are received on the twisted pair interface from a link partner and used to wake up the MxL86211C and enter auto-negotiation.

**Figure 12 State Diagram for Power Down State Management**

#### 3.7.2 RESET Power Up

This is the state in which the MxL86211C starts up after either a hardware reset or power up.

Once initialized, the MxL86211C will always transition to SCAN state.

#### 3.7.3 POWER DOWN State

The POWER DOWN state is entered by setting “power down” bit 11 of the MDIO standard register STD\_CTRL (0.11) to logic 1, regardless of the current state of the device. The POWER DOWN state corresponds to power down as specified in IEEE 802.3, Clause 22.2.4.1.5. Some signal processing blocks are stopped to save energy, but the MxL86211C still responds to MDIO messages. The SGMII interface to the MAC SoC is switched off as well.

The POWER DOWN state exit is triggered by setting the MDIO standard register (0.11), which generates a transition to SCAN state.

### 3.7.4 SCAN State

The SCAN state differs from the POWER DOWN state because the receiver periodically scans for signal energy or FLP bursts on the TPI. There is no transmission in this state. When a FLP burst is received, the MxL86211C enters the auto-negotiation protocol to exchange capabilities with the link partner and establish a data link in the NORMAL state.

### 3.7.5 PING State

The PING state is similar to the SCAN state except that the transceiver transmits an FLP burst onto the TPI for a programmable amount of time. This is used to wake potential link partners from the POWER DOWN state. This state corresponds to the state of “ANEG” described in Clause 28 of the IEEE standard [1].

### 3.7.6 LP State

The Low Power (LP) state in MxL86211C is enabled by configuring MDIO register PHY\_CTL2.LP. The LP state is entered automatically when there is no Ethernet cable connected to the MxL86211C. The MxL86211C firmware detects this condition when no energy or FLP is present on the TPI and enters the LP state. It is intended to set the MxL86211C into its maximum power saving state. In this state, most digital domains are in reset. Only a minimal amount of circuitry (analog/digital) operates to detect signal energy on the receiver of a TPI and trigger a wake-up.

When the MxL86211C is in LP state, the STA does not have access to the MDIO/MMD registers.

The LP state is exited upon detection of signal energy on the twisted pair (either NLP or FLP). The MxL86211C transitions to the RESET Power Up state automatically.

It is possible for the STA host to be informed of the LP entry condition and can choose to acknowledge it before granting LP entry. By setting PHY\_IMASK.LP bit to ACTIVE, the STA requests the MDINT interrupt from MxL86211C when the entry conditions are met. If PHY\_CTL2.LP\_STA\_BLOCK is ON then MxL86211C will enter LP only after STA reads the interrupt status register PHY\_ISTAT else the entry to LP is unconditional. All the LP related control bits and communication mechanism between STA and GPY is shown in the flowchart in [Figure 13](#).

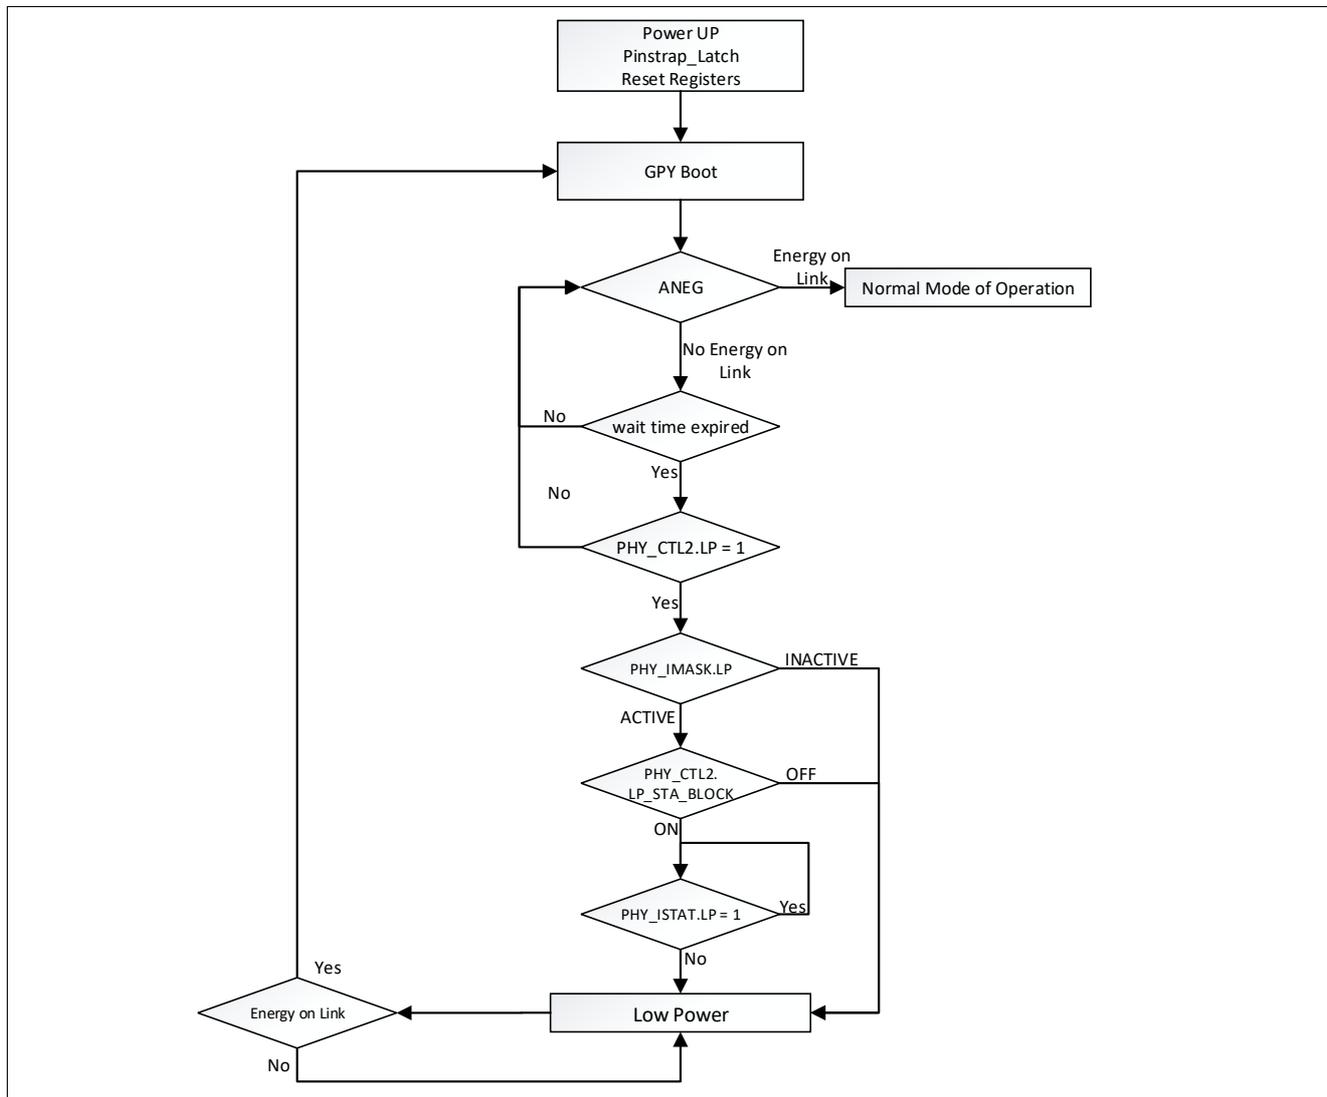

Figure 13 LP Sequence

Table 14 LP State Entry and Exit Sequence

Step	State	Remark
1	ACTIVE, the LP feature is enabled by programming PHY_CTL2.LP = 1.	Use MDIO register PHY_CTL2.LP to enable / disable the LP feature.
2	ANEG, Ability Detect	The firmware detects no energy on the cable when no FLP is received for a long period of time. This time can be configured with register: VSPEC1_NBT_DS_CTRL.NRG_RST_CNT (value to program = time in seconds). Default time is 4 seconds (VSPEC1_NBT_DS_CTRL.NRG_RST_CNT = 4).
3	LP Entry	MxL86211C saves MDIO LP persistent registers.

**Table 14 LP State Entry and Exit Sequence (cont'd)**

<b>Step</b>	<b>State</b>	<b>Remark</b>
4	LP	Power consumption is saved in this state. MxL86211C listen to energy pulses from Link Partner ANEG as a condition to trigger LP exit. Only a minimal amount of circuitry operates to detect signal energy on TPI and trigger a wake-up. MxL86211C GPIOs, LEDs and MDIO interface are disabled.
5	LP Exit, based on Energy detected on cable.	MxL86211C restores the MDIO LP persistent registers. The STA is responsible to restore any custom MDIO information that were not saved in the group of LP persistent registers.
6	ANEG, LINK-UP and ACTIVE	MxL86211C operates in Normal Power Modes.

These are persistent MDIO registers saved and restored during LP entry-exit.

### 3.7.7 NORMAL State

The NORMAL state is used to establish and maintain a link connection. If a connection is dropped, the MxL86211C moves back into SCAN state.

### 3.7.8 Low-Power IDLE State: Energy-Efficient Ethernet

The IEEE 802.3 standard [1] describes the Energy-Efficient Ethernet (EEE) operation that is supported by the MxL86211C. EEE is supported in the various speeds of 10BASE-Te, 100BASE-TX, 1000BASE-T, and 2.5GBASE-T. The general idea of EEE is to save power during periods of low link utilization. Instead of sending active idle data, the transmitters are switched off for a short period of time. This is called the quiet period in the standard. The link is kept active by means of a frequent refresh cycle initiated by the PHY itself during low power state. This sequence is repeated until a wake request is generated by one of the link partner MACs. MxL86211C follows the IEEE 802.3 standard regarding EEE. The principle is shown in Figure 14. This state is entered automatically when the low-power idle conditions are met.

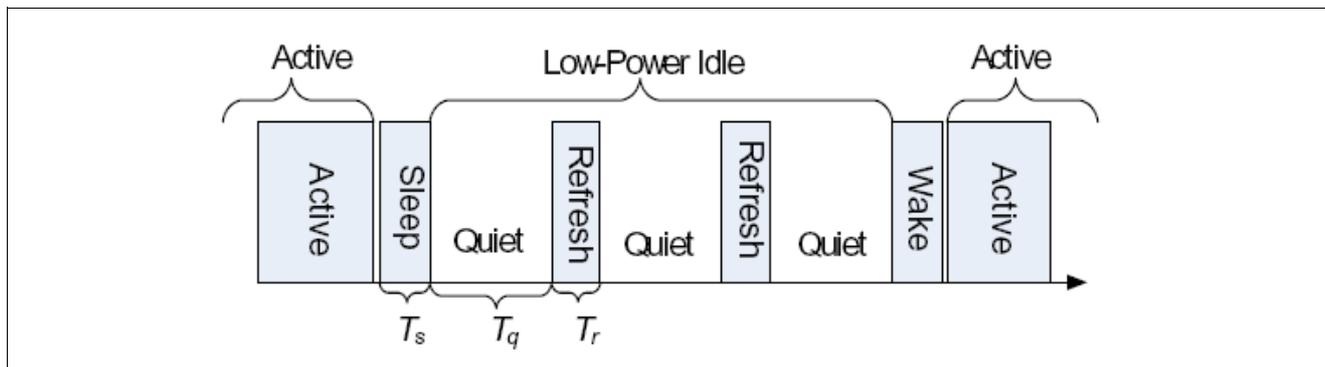

Figure 14 EEE Low-Power Idle Sequence

### 3.8 Dynamic Voltage Scaling

MxL86211C supports the Dynamic Voltage Scaling (DVS) feature which is the option to control the 0.97 V supply voltage based on process corner and GPHY operation mode. The DVS is enabled by default to reduce the maximum power consumption. It generates a Pulse Width Modulation (PWM) signal on the **DVS** pin which is used to control the 0.97 V supply voltage provided externally by the DCDC. Hence the supply is regulated to an optimal voltage. DVS can be disabled by changing the setting of VSPEC1\_PM\_CTRL.DVS\_DIS.

If the external DCDC does not support the PWM signal, the PWM signal can be converted into analog signal and connected to the voltage reference of the DCDC, with additional passive components on the PCB. Refer to the relevant hardware documentation available at <https://maxlinear.com/myMxL> for more details.

### 3.9 Firmware Upgrade

The MxL86211C provides a firmware upgrade feature, that allows feature and functional enhancements of the MxL86211C in the field.

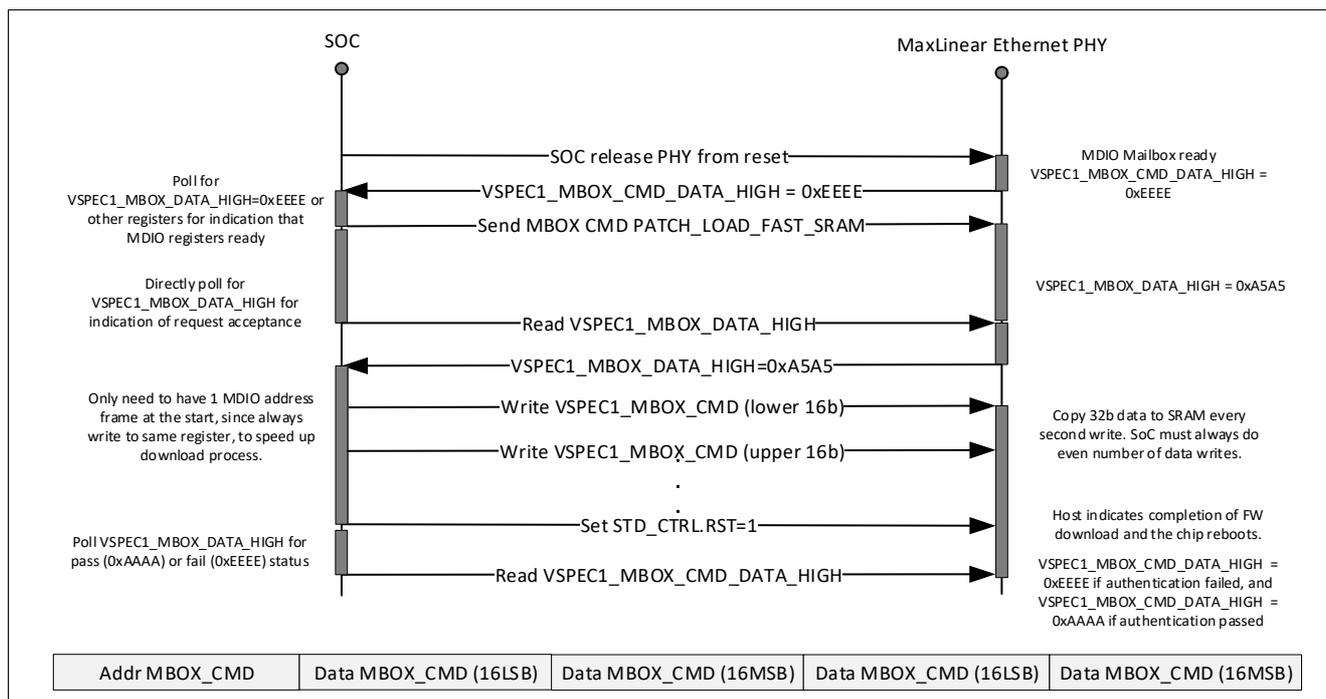

Initially, the MxL86211C is provided with a permanent on-chip firmware image in the ROM.

A new firmware image can be downloaded into an on-chip memory and the MxL86211C can fetch the upgraded firmware from this memory after a reboot.

The host MAC SoC can initiate the firmware upgrade process any time after the MDIO interface is ready. MaxLinear provides an API to facilitate the firmware upgrade. To upgrade the MxL86211C's firmware image, the device must be put into the reset state and restarted. This allows the usual **Power-On Sequence** to occur and allows the download of a MaxLinear signed firmware image into the on-chip SRAM using the MDIO slave interface. The **Super Isolate** mode can be used to prevent MxL86211C from executing the internal firmware image in the ROM, before the firmware upgrade process is started.

Once the firmware image has been transferred to the MxL86211C's on-chip memory, it is authenticated. For security reasons, the MxL86211C will only accept firmware images, which are electronically signed by MaxLinear. In case the downloaded image cannot be authenticated by the MxL86211C or the image download is aborted or fails, the MxL86211C will default to run from the internal firmware image in the ROM.

The MAC SoC interaction with the MxL86211C for the FW download to SRAM is described in **Figure 15**.

**Figure 15 Firmware upgrade**

The GPY API describing the driver software executed on the MAC SoC must be followed to execute this feature. It provides information on the update process and which actions are required in the MAC SoC application.

Security feature to prevent rollback of image to a previous version (Anti-Rollback) is not supported within the MxL86211C. If the system (SoC) to which the MxL86211C is attached, mandates such features, they can be supported by the system. The host software is expected to verify a firmware before downloading it to the SRAM, and that the version number of the new firmware is higher than the one installed.

## 4 MDIO and MMD Register Interface Description

The following sections describe the MDIO and MMD registers, which are standardized by IEEE 802.3 [1], and available to support the MxL86211C feature set. These registers can be accessed by an external management entity (also called STA in IEEE) to control, configure or read the status of the MxL86211C. After power-on, the MxL86211C resets the MDIO and MMD registers to default values that are sufficient to operate without specific programming.

All the register definitions, behaviors and fields are strictly compliant with the IEEE 802.3 [1]. Refer to IEEE 802.3 for more detailed explanations of the registers. The only registers that are not referenced in IEEE 802.3 are two register groups that are “vendor specific”: VSPEC1 and VSPEC2. These allow custom functions related to the MxL86211C. In the register descriptions, the section or table references refer to the IEEE 802.3 [1] documents.

### 4.1 Definitions

The following acronyms are used in the IEEE 802.3 standard and commonly used in the Ethernet technical domain:

- **STA:** Station Management. A host connected to the MDIO interface. STAs are generally Media Access Controllers (MACs). The STA drives the MDIO bus as a clock master and the MxL86211C is MDIO slave.
- **Host:** Used as a synonym of STA in this document.
- **PHY:** Physical Layer. In the MxL86211C this encompasses Analog Signal Processing, Digital Signal Processing, PCS. The PHY contains several sub-layers that are individually manageable entities known as MDIO manageable devices (MMDs).
- **MMD:** MDIO Manageable Device. The list of MMDs available in the MxL86211C is in [Chapter 4.3](#).
- **Device:** In the context of MDIO/MMD registers, a device is a register bank grouped by logical sub-layers of the PHY layer.
- **Clause:** Refers to a particular section of the IEEE 802.3 standard [1]. In particular Clause 22 describes MDIO device 0, and Clause 45 describes the other MMDs.
- **MII:** Media Independent Interface. This encompasses the MDIO as well as the (G)MII as described in Clause 22. STD registers in device 0 are also called MII registers.

## 4.2 Register Naming and Numbering

The register numbering convention in this document is similar to that of IEEE 802.3:

The numbering syntax uses 3 numbers “a.b.c” as specified in IEEE 802.3 paragraph 45.1, and the notation is generalized to Clause 22 registers in device 0 “STD”. The alphanumeric syntax also uses the same structure and uses the names of the MMD devices, registers and register fields separated by underscore and dot as described below.

### 4.2.1 Register Numbering

The syntax is as follows, with a, b, c written as decimal numbers:

a.b.c = <DEVICE\_NUMBER>.<REGISTER\_NUMBER>.<FIELD\_NUMBER>

When the last indicator (c) is omitted, the register numbering refers to the full register.

When a field is more than a single bit, the bit range is indicated using a semicolon (e.g. 1:3 is the field of bits 1 to 3). In an MDIO register, the least significant bit is bit 0 and most significant bit is bit 15. All MDIO registers are 16 bit wide.

### 4.2.2 Register Naming

The syntax is as follows, with AA, BB, CC written as alphanumeric strings:

AA.BB.CC = <DEVICE\_NAME>\_<REGISTER\_NAME>.<FIELD\_NAME>

When the last indicator (CC) is omitted, the register naming refers to the full register.

The fields named Res, RES1, and RES2 refer to reserved fields as per IEEE 802.3 documents.

### 4.2.3 Examples

STD\_STAT.ANOK is the name of the field 0.1.5, which indicates auto-negotiation complete.

ANEG\_CTRL.ANEG\_RESTART is the name of the field 7.0.9, which allows the STA to restart the Ethernet ANEG procedure.

ANEG\_PHYID1 is the complete 16-bit register number 7.2, for the PHY identifier 1 number.

VSPEC1\_LED1.BLINKS is the 4-bit wide field number 30.2.15:12, which contains LED1 slow blinking configuration.

### 4.3 MMD Devices Present in MxL86211C

The MMD devices implement groups of standardized registers under the management of the STA. They are defined in IEEE 802.3.

**Table 15 MDIO / MMD Devices Present in MxL86211C**

MDIO / MMD Name	Device Number (decimal)	Description
STD	0	MDIO Standard Device as described in Clause 22. This also contains a number of PHY registers that are MxL86211C specific.
PMAPMD	1	Control and status registers related to PMA/PMD signal processing modules.
PCS	3	Control and status registers related to PCS encoding/decoding device.
ANEG	7	Control and status registers related to auto-negotiation device.
VSPEC1	30	MxL86211C-specific LED control and MxL86211C SGMII control.
VSPEC2	31	MxL86211C-specific Wake-on-LAN control.

### 4.4 Responsibilities of the STA

The MxL86211C responds to all published register addresses for the device and returns a value of zero for undefined and unsupported registers.

As per IEEE 802.3 guidelines, it is the responsibility of the STA entity to ensure that mutually acceptable speeds are applied consistently across all the MMDs of the MxL86211C.

The MxL86211C ignores writes to the PMA/PMD speed selection bits that select speeds which are not advertised in the PMA/PMD speed ability register. The PMA/PMD speed selection defaults to a supported ability.

### 4.5 MDIO Access Protocols to Read / Write Registers

All the MDIO/MMD registers can be accessed from an external chip connected to the MDIO bus on the MDIO and MDC pins. The MxL86211C supports several MDIO frame protocols:

- Clause 22: To access Device 0
- Clause 22 Extended: To access other devices (Dev 1: PMAPMD, Dev 3: PCS, Dev7: ANEG, Dev 30: VSPEC1, DEV 31: VSPEC2) using the indirection scheme specified by IEEE 802.3.
- Clause 45: to access all devices

Both Clause 22 Extended and Clause 45 can be used to access MMD devices. However, the mechanism implemented in the MxL86211C provides faster speeds using Clause 45, so there are some differences in latencies in the MDIO reply:

- Protocol "Clause 22 Extended" involves the MxL86211C an indirection mechanism.
- Protocol "Clause 45" provides faster replies.

The Clause 22 registers can be accessed using the Clause 45 electrical interface and the Clause 22 management frame structure [IEEE 802.3 section 45.2].

## 5 MDIO Registers Detailed Description

**Table 16 Register Access Type**

Mode	Symbol
Status Register, (Status, or Ability Register)	RO
Read-Write Register, (e.g. MDIO Register)	RW
Read-Write, Self-Clearing Register (bit is cleared after read from MDIO)	RWSC
Read-Only, Self-Clearing Register (bit is cleared after read from MDIO)	ROSC
Read-Only Latching Low Register	ROLL
Read-Only Latching High Register	ROLH

## 5.1 Standard Management Registers

This section describes the IEEE 802.3 standard management registers corresponding to Clause 22.

**Table 17 Registers Overview**

Register Short Name	Register Long Name	Reset Value
<a href="#">STD_CTRL</a>	STD Control (Register 0.0)	3040 <sub>H</sub>
<a href="#">STD_STAT</a>	Status Register (Register 0.1)	7949 <sub>H</sub>
<a href="#">STD_PHYID1</a>	PHY Identifier 1 (Register 0.2)	C133 <sub>H</sub>
<a href="#">STD_PHYID2</a>	PHY Identifier 2 (Register 0.3)	5400 <sub>H</sub> <sup>1)</sup>
<a href="#">STD_AN_ADV</a>	Auto-Negotiation Advertisement (Register 0.4)	91E1 <sub>H</sub>
<a href="#">STD_AN_LPA</a>	Auto-Negotiation Link Partner Ability (Register 0.5)	0000 <sub>H</sub>
<a href="#">STD_AN_EXP</a>	Auto-Negotiation Expansion (Register 0.6)	0064 <sub>H</sub>
<a href="#">STD_AN_NPTX</a>	Auto-Negotiation Next Page Transmit Register (Register 0.7)	2001 <sub>H</sub>
<a href="#">STD_AN_NPRX</a>	Auto-Negotiation Link Partner Received Next Page Register (Register 0.8)	0000 <sub>H</sub>
<a href="#">STD_GCTRL</a>	Gigabit Control Register (Register 0.9)	0200 <sub>H</sub>
<a href="#">STD_GSTAT</a>	Gigabit Status Register (Register 0.10)	0000 <sub>H</sub>
<a href="#">STD_MMDCTRL</a>	MMD Access Control Register (Register 0.13)	0000 <sub>H</sub>
<a href="#">STD_MMDDATA</a>	MMD Access Data Register (Register 0.14)	0000 <sub>H</sub>
<a href="#">STD_XSTAT</a>	Extended Status Register (Register 0.15)	2000 <sub>H</sub>

1) For the device specific reset value, refer to the Product Naming table in the [Package Outline](#) chapter.

### 5.1.1 Standard Management Registers

This chapter describes all registers of STD in detail.

#### STD Control (Register 0.0)

This register controls the main functions of the PHY.

IEEE Standard Register=0.0

STD_CTRL										Reset Value	
STD Control (Register 0.0)										3040 <sub>H</sub>	
15	14	13	12	11	10	9	8	7	6	5	0
RST	LB	SSL	ANEN	PD	ISOL	ANRS	DPLX	COL	SSM		RES
rwsc	rw	rw	rw	rw	rw	rwsc	rw	rw	rw		ro

Field	Bits	Type	Description
RST	15	RWSC	<b>Reset</b> Resets the PHY to its default state. Active links are terminated. Note that this is a self-clearing bit which is set to zero by the hardware after reset has been done. See also IEEE 802.3 22.2.4.1.1. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>RESET</b> Resets the device
LB	14	RW	<b>Loop-Back on GMII</b> This mode enables looping back of MII data (SGMII) from the transmit to the receive direction. No data is transmitted to the Ethernet PHY. The device operates at the selected speed. The collision signal remains de-asserted unless otherwise forced by the collision test. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>ENABLE</b> Closes the loop-back from TX to RX at xMII
SSL	13	RW	<b>Forced Speed Selection LSB</b> This bit only takes effect when the auto-negotiation process is disabled, that is, bit ANEN is set to zero. This is the lower bit (LSB) of the forced speed selection. In conjunction with the higher bit (MSB) , the following encoding is valid: MSB LSB bit values: 0 0 = 10 Mbit/s 0 1 = 100 Mbit/s 1 0 = 1000 Mbit/s 1 1 = Reserved, defaults to 2500 Mb/s if the PMA_CTRL register 1.0.5:2 is equal to [0 1 1 0 ] The standard procedure to force the 2500 Mb/s (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0 ] GPY PHY mirrors 1.0.6, 1.0.13 and 0.0.6 , 0.0.13
ANEN	12	RW	<b>Auto-Negotiation Enable</b> Allows enabling and disabling of the auto-negotiation process capability of the PHY. If enabled, the force bits for duplex mode (CTRL.DPLX) and the speed selection (CTRL.SSM, CTRL.SSL) become inactive. Otherwise, the force bits define the PHY operation. See also IEEE 802.3 22.2.4.1.4. 0 <sub>B</sub> <b>DISABLE</b> Disable the auto-negotiation protocol 1 <sub>B</sub> <b>ENABLE</b> Enable the auto-negotiation protocol
PD	11	RW	<b>Power Down</b> Forces the device into a power down state (SLEEP) in which power consumption is the bare minimum required to still maintain the MII management interface communication. When activating the power down functionality, the PHY terminates active data links. The MII interface is also stopped in power down mode. See also IEEE 802.3 22.2.4.1.5. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>POWERDOWN</b> Forces the device into power down mode

Field	Bits	Type	Description (cont'd)
ISOL	10	RW	<b>Isolate</b> The isolation mode isolates the PHY from the MAC. MAC interface inputs are ignored, whereas MAC interface outputs are set to tristate (high-impedance). See also IEEE 802.3 22.2.4.1.6. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>ISOLATE</b> Isolates the PHY from the MAC
ANRS	9	RWSC	<b>Restart Auto-Negotiation</b> Restarts the auto-negotiation process on the MDI. This bit does not take any effect when auto-negotiation is disabled using (CTRL.ANEN). Note that this bit is self-clearing after the auto-negotiation process is initiated. See also IEEE 802.3 22.2.4.1.7. 0 <sub>B</sub> <b>NORMAL</b> Stay in current mode 1 <sub>B</sub> <b>RESTART</b> Restart auto-negotiation
DPLX	8	RW	<b>Forced Duplex Mode</b> Note that this bit only takes effect when the auto-negotiation process is disabled, that is, bit CTRL.ANEN is set to zero. This bit controls the forced duplex mode. It allows forcing of the PHY into full or half-duplex mode. Note that this bit does not take effect in loop-back mode, that is, when bit CTRL.LB is set to "1". See also IEEE 802.3 22.2.4.1.8. The Duplex mode can only be forced to Half Duplex in 10BT and 100BT speed modes. This field is ignored for higher speeds. 0 <sub>B</sub> <b>HD</b> Half duplex 1 <sub>B</sub> <b>FD</b> Full duplex
COL	7	RW	<b>Collision Test</b> Allows testing of the COL signal at the xMII interface. When the collision test is enabled, the state of the TX_EN signal is looped back to the COL signal within a minimum latency. See also IEEE 802.3 22.2.4.1.9. 0 <sub>B</sub> <b>DISABLE</b> Normal operational mode 1 <sub>B</sub> <b>ENABLE</b> Activates the collision test
SSM	6	RW	<b>Forced Speed Selection MSB</b> This bit only takes effect when the auto-negotiation process is disabled, that is, bit ANEN is set to zero. This is the most significant bit (MSB) of the forced speed selection. In conjunction with the lower bit, (LSB), the following encoding is valid: MSB LSB: 0 0 = 10 Mbit/s 0 1 = 100 Mbit/s 1 0 = 1000 Mbit/s 1 1 = Reserved, defaults to 2500 Mb/s if the PMA_CTRL (1.0.5:2 = [0 1 1 0 ] ) The preferred way to force the 2500 Mb/s (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0 ] GPY mirrors 1.06, 1.0.13 and 0.0.6 , 0.0.13
RES	5:0	RO	<b>Reserved</b> Write as zero, ignore on read.

**Status Register (Register 0.1)**

This register contains status and capability information about the device. Note that all bits are read-only. A write access by the MAC does not have any effect. See also IEEE 802.3 22.2.4.2.

Field	Bits	Type	Description
ACTYPE	15:14	RW	<b>Access Type Function</b> If the access of register MMDDATA is an address access (ACTYPE=0) then it is directed to the address register within the MMD associated with the value in the DEVAD field. Otherwise, both the DEVAD field and the MMD's address register direct the register MMDDATA data accesses to the appropriate registers within that MMD. 00 <sub>B</sub> <b>ADDRESS</b> Accesses to register MMDDATA access the MMD individual address register 01 <sub>B</sub> <b>DATA</b> Accesses to register MMDDATA access the register within the MMD selected 10 <sub>B</sub> <b>DATA_PI</b> Accesses to register MMDDATA access the register within the MMD selected 11 <sub>B</sub> <b>DATA_PIWR</b> Accesses to register MMDDATA access the register within the MMD selected

Field	Bits	Type	Description (cont'd)
RESH	13:8	RO	<b>Reserved</b> Write as zero, ignored on read.
RESL	7:5	RO	<b>Reserved</b> Write as zero, ignored on read.
DEVAD	4:0	RW	<b>Device Address</b> The DEVAD field directs any accesses of register MMDDATA to the appropriate MMD as described in IEEE 802.3 Clause 45.2.

#### MMD Access Data Register (Register 0.14)

The MMD access data register is used in conjunction with the MMD access control (MMDCTRL) register to access the MMD register space. For more information on MMD access, refer to IEEE 802.3 Clause 22.2.4.3.12, Clause 45.2 and Annex 22D.

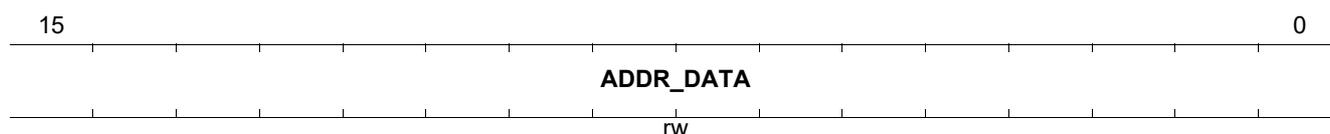

IEEE Standard Register=0.14

#### STD\_MMDDATA

Reset Value

#### MMD Access Data Register (Register 0.14)

0000<sub>H</sub>

Field	Bits	Type	Description
ADDR_DATA	15:0	RW	<b>Address or Data Register</b> This register accesses either a specific MMD address register or the data content of the MMD register to which this address register points. Which of the functions is currently valid is defined by the MMDCTRL register.

#### Extended Status Register (Register 0.15)

This register contains extended status and capability information about the PHY. Note that all bits are read-only. A write access does not have any effect.

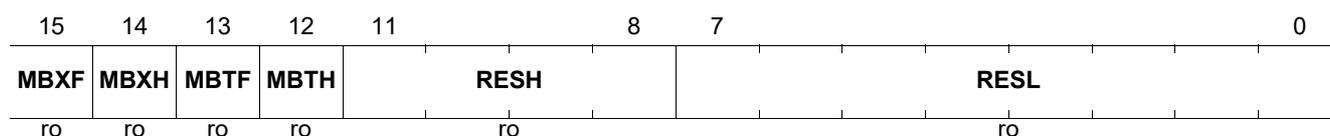

IEEE Standard Register=0.15

### 5.2.1 GPY-specific Management Registers

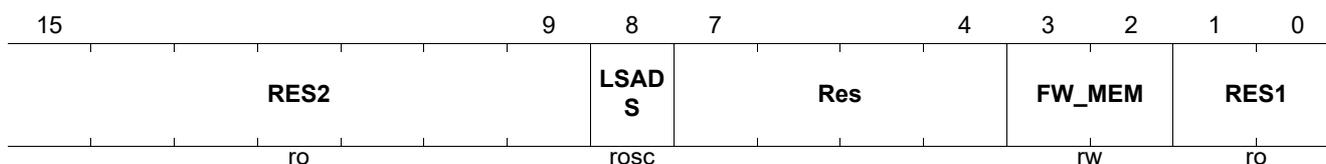

This chapter describes all registers of PHY in detail.

#### Physical Layer Status 1 (Register 0.17)

This register reports PHY link information, for example link-up, polarity reversals and port mapping. The content of this register is only valid when the link is up.

IEEE Standard Register=0.17

**PHY\_STAT1** **Reset Value**  
**Physical Layer Status 1 (Register 0.17)** **0000<sub>H</sub>**

Field	Bits	Type	Description
RES2	15:9	RO	<b>Reserved</b> Write as zero, ignored on read.
LSADS	8	ROSC	<b>Link Speed Auto-Downspeed Status</b> Monitors the status of the auto-downspeed. 0 <sub>B</sub> <b>NORMAL</b> Did not perform any link speed auto-downspeed 1 <sub>B</sub> <b>DETECTED</b> Detected an auto-downspeed

Field	Bits	Type	Description (cont'd)
FW_MEM	3:2	RW	<b>Firmware Memory Location</b> Indicate memory target used for firmware execution 00 <sub>B</sub> <b>ROM</b> Firmware is executed from ROM 11 <sub>B</sub> <b>RAM</b> Firmware is executed from SRAM Others: Reserved.
RES1	1:0	RO	<b>Reserved</b> Write as zero, ignored on read.

**Physical Layer Control 1 (Register 0.19)**

This register controls the PHY functions.

IEEE Standard Register=0.19

**PHY\_CTL1**
**Reset Value**
**Physical Layer Control 1 (Register 0.19)**

Res			SDET P	STICKY Y	RES1		LP_ST A*	LP	PSCL	ANPD	LPI
			rw	rw	ro		rw	rw	rw	rw	rw

Field	Bits	Type	Description
SDETP	9	RW	<b>Signal Detection Polarity for the 1000BASE-X PHY</b> This field is reserved as 1000BASE-X is not supported on this PHY port.
STICKY	8	RW	<b>Sticky-Bit Handling</b> Setting this bit to 1 ensures that all the vendor specific registers (of type RW) in PHY ( device 0 ), VSPEC1 ( device 30) and VSPEC2 ( device 31) are not changed during a MDIO reset or software reset of GPY. This allows the STA to keep the configurations chosen before reset. 0 <sub>B</sub> <b>OFF</b> Sticky-bit handling is disabled 1 <sub>B</sub> <b>ON</b> Sticky-bit handling is enabled
RES1	7:5	RO	<b>Reserved</b> Write as zero, ignored on read.

Field	Bits	Type	Description (cont'd)
LP_STA_BLOCK	4	RW	<p><b>Low Power Mode entry block by acknowledgment from STA</b></p> <p>Low Power Mode entry block by acknowledgment from STA</p> <p>When PHY_IMASK.LP = ACTIVE, intent to LP entry is indicated to STA. For the GPY to enter unconditionally without acknowledgment from STA, set PHY_CTL2.LP_STA_BLOCK = OFF.</p> <p>For blocking LP entry till the acknowledgment is received from STA, set PHY_CTL2.LP_STA_BLOCK = ON.</p> <p>This bit has no effect when PHY_IMASK.LP = INACTIVE.</p> <p>0<sub>B</sub> <b>OFF</b> LP Entry without the role of STA. GPY will enter LP unconditionally without acknowledgment from STA</p> <p>1<sub>B</sub> <b>ON</b> LP Entry Blocked by STA. GPY will enter LP only after STA reads the LP interrupt status register PHY_ISTAT</p>
LP	3	RW	<p><b>Low Power Mode</b></p> <p>Low Power Mode (LP) allows GPY to save energy by disabling most of the digital logic to reduce power consumption to its lowest level. The entry to LP is triggered when the PHY does not sense any energy on the cable and that no Link pulses (NLP, FLP, Beacons) are received. After spending VSPEC1_NBT_DS_CTRL.NRG_RST_CNT without energy in the ABILITY_DETECT state defined by IEEE 802.3 Clause 28, the PHY enters LP.</p> <p>0<sub>B</sub> <b>OFF</b> LP is Disabled. GPY will not never enter LP.</p> <p>1<sub>B</sub> <b>ON</b> LP is Enabled. GPY will enter LP is no energy</p>
PSCL	2	RW	<p><b>Power Consumption Scaling Depending on Link Quality</b></p> <p>Allows enabling/disabling of the power consumption scaling dependent on the link quality.</p> <p>0<sub>B</sub> <b>OFF</b> PSCL is disabled</p> <p>1<sub>B</sub> <b>ON</b> PSCL is enabled</p>
ANPD	1	RW	<p><b>Auto-Negotiation Power Down</b></p> <p>Allows enabling/disabling of the power down modes during auto-negotiation looking for a link partner.</p> <p>0<sub>B</sub> <b>OFF</b> ANPD is disabled</p> <p>1<sub>B</sub> <b>ON</b> ANPD is enabled</p>
LPI	0	RW	<p><b>Assert LPI via MDIO</b></p> <p>Controls Asserts/de-asserts of LPI by MDIO instead of following (X)GMII LPI</p> <p>Used to force the EEE on the TPI (ignoring the LPI indication from MAC)</p> <p>0<sub>B</sub> <b>DEASSERT</b> LPI is de-asserted TPI</p> <p>1<sub>B</sub> <b>ASSERT</b> LPI is asserted on TPI</p>

### Error Counter (Register 0.21)

This register controls the error counter. It allows the number of errors detected in the PHY to be counted for monitoring purposes.

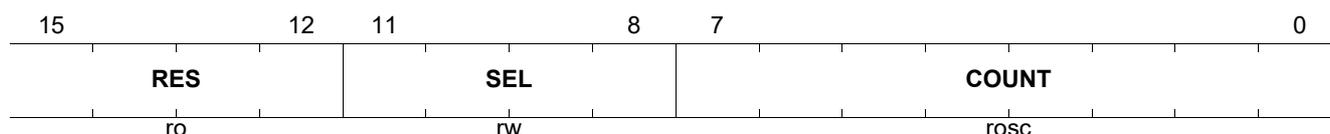

IEEE Standard Register=0.21

#### PHY\_ERRCNT

Reset Value

#### Error Counter (Register 0.21)

0000<sub>H</sub>

Field	Bits	Type	Description
RES	15:12	RO	<b>Reserved</b> Write as zero, ignored on read.

### LED Control Register (Register 0.27)

This register contains control bits for direct access to the LEDs by setting the on/off LEDxA bits ( with x from 0 to 4). To directly control the LED, the integrated LED functions must be disabled by the LEDxEN bit in this register.

The integrated LED functions are specified in the more sophisticated LED control registers in MMD device VSPEC1.

IEEE Standard Register=0.27

MINOR	7:0	RO	<b>Minor Version Number</b> Specifies the sub-version release number of the firmware.

**Internal Test Modes CDIAG and ABIST (Register 0.31)**

This is the control register used to configure the Gigabit Ethernet behavior of the PHY. See also IEEE 802.3 40.5.1.1.

IEEE Standard Register=0.31

**PHY\_TEST**
**Reset Value**
**Internal Test Modes CDIAG and ABIST (Register 0.31)**
**0000<sub>H</sub>**

Field	Bits	Type	Description
TM	15:13	RW	<b>Proprietary Test Modes ABIST and CDIAG</b> Enter the test mode. Any value different from 6 or 7 has no effect. 110 <sub>B</sub> <b>CDIAG</b> GPY specificCable Diagnostic 111 <sub>B</sub> <b>ABIST</b> GPY specificAnalog build in self-test
RES	12:8	RW	<b>Reserved</b>
ABUART	7	RW	<b>ABIST UART output for debug</b> If set to 1, enable detail report on the debug UART output. This is used to debug the feature and not in production mode, because in that case the 2 LED signals are not used to indicate completion or pass fail. An alternative to UART is to read the STB via MDIO commands. 0 <sub>B</sub> <b>NORMAL</b> ABIST normal output 1 <sub>B</sub> <b>UART</b> ABIST output to UART
ABRET	6	RW	<b>ABIST ReTrig</b> If set to 1, enable restart of the selected ABIST test. This is used to debug the feature and not in production mode 0 <sub>B</sub> <b>NORMAL</b> Normal Mode 1 <sub>B</sub> <b>RETRIG</b> Restart the current ABIST Test
ABSEL	5:4	RW	<b>ABIST sub-mode selection</b> 00 <sub>B</sub> , ABIST Analog Tests 01 <sub>B</sub> , ABIST DC tests 10 <sub>B</sub> , reserved 11 <sub>B</sub> , reserved 00 <sub>B</sub> <b>ANALOG</b> ABIST Analog Tests 01 <sub>B</sub> <b>DC</b> ABIST DC Tests
ABOPT	3:0	RW	<b>ABIST Option for DC test</b> In ABIST DC test 0000, ABIST DC test for 10BT mode LD, max positive differential level 0001, ABIST DC test for 1000BT mode LD, max positive differential level 0010, ABIST DC test for 10BT mode LD, 0 differential level 0011, ABIST DC test for 1000BT mode LD, 0 differential level 0100, ABIST DC test for 10BT mode LD, max negative differential level 0101, ABIST DC test for 1000BT mode LD, max negative differential level 0110, ABIST DC test for 2500BT mode LD, max positive differential level 0111, ABIST DC test for 2500BT mode LD, 0 differential level 1000, ABIST DC test for 2500BT mode LD, max negative differential level

## 6 MMD Registers Detailed Description

**Table 19 Register Access Type**

Mode	Symbol
Status Register, (Status, or Ability Register)	RO
Read-Write Register, (e.g. MDIO Register)	RW
Read-Write, Self-Clearing Register (bit is cleared after read from MDIO)	RWSC
Read-Only, Self-Clearing Register (bit is cleared after read from MDIO)	ROSC

RST	Res	SSL	Res	LOW_POWER*	Res	SSM	SPEED_SEL			NS1	NS2
rw		rw		rw		rw	rw			ro	ro

Field	Bits	Type	Description
RST	15	RW	<b>Reset</b> 1 = PMA/PMD reset 0 = Normal operation
SSL	13	RW	<b>Speed Selection (LSB)</b> Used in conjunction with field SPEED_SEL_MSB MSB LSB: 1 1 = bits 5:2 are used to select speed (SPEED_SEL field) 1 0 = 1000 Mb/s 0 1 = 100 Mb/s 0 0 = 10 Mb/s
LOW_POWER	11	RW	<b>Low power</b> 1 = Enter Low power mode 0 = Normal operation

Field	Bits	Type	Description (cont'd)
SSM	6	RW	<b>Speed Selection (MSB)</b> Used in conjunction with field SPEED_SEL_LSB MSB LSB: 1 1 = bits 5:2 select speed (SPEED_SEL field) 1 0 = 1000 Mb/s 0 1 = 100 Mb/s 0 0 = 10 Mb/s
SPEED_SEL	5:2	RW	<b>Speed Selection</b> Bit usage ( from bit 5 to bit 2): 1 x x x = Reserved 0 1 1 1 = Not supported 0 1 1 0 = 2.5 Gb/s 0 1 0 0 = Not supported, defaults to 2.5 Gb/s 0 0 1 1 = Not supported, defaults to 2.5 Gb/s 0 0 1 0 = Not supported, defaults to 2.5 Gb/s 0 0 0 1 = Not supported, defaults to 2.5 Gb/s 0 0 0 0 = Not supported, defaults to 2.5 Gb/s 0110 <sub>B</sub> <b>S2G5</b> Forced Speed is 2G5
NS1	1	RO	<b>Not Supported</b> PMA remote loop-back mode is not supported by GPY
NS2	0	RO	<b>Not Supported</b> PMA local loop-back mode is not supported by GPY

**PMA/PMD status 1 (Register 1.1)**

IEEE Standard Register=1.1

**PMA\_STAT1**
**PMA/PMD status 1 (Register 1.1)**
**Reset Value**
**0000<sub>H</sub>**

15	8	7	6	3	2	1	0
Res		<b>FAUL T</b>	Res		<b>RX_LI NK*</b>	<b>LOW_ POW*</b>	Res
		ro			ro	ro	

Field	Bits	Type	Description
FAULT	7	RO	<b>Fault</b> 1 = Fault condition detected 0 = Fault condition not detected
RX_LINK_STA TUS	2	RO	<b>Receive Link Status</b> 1 = PMA/PMD receive link up 0 = PMA/PMD receive link down
LOW_POWER _ABILITY	1	RO	<b>Low Power Ability</b> 1 = PMA/PMD supports low power mode 0 = PMA/PMD does not support low power mode

**PHY Identifier 1 (Register 1.2)**

IEEE Standard Register=1.2

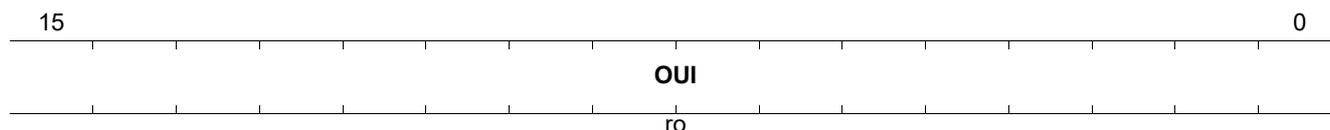

Bits 31 - 16 of Device ID

**PMA\_DEVID1**

**Reset Value**

**PHY Identifier 1 (Register 1.2)**

**C133<sub>H</sub>**

Field	Bits	Type	Description
OUI	15:0	RO	<b>Organizationally Unique Identifier</b> Organizationally Unique Identifier Bits 3:18

**PHY Identifier 2 (Register 1.3)**

IEEE Standard Register=1.3

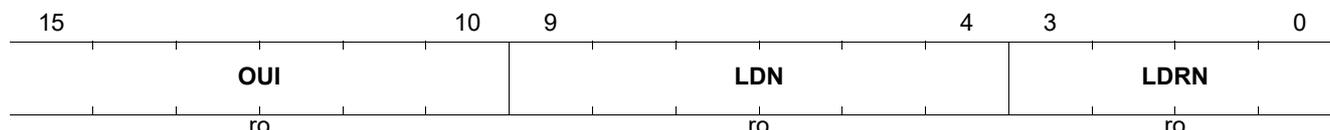

Bits 15 - 0 of Device ID

**PMA\_DEVID2**

**Reset Value**

**PHY Identifier 2 (Register 1.3)**

**5400<sub>H</sub>**

Field	Bits	Type	Description
OUI	15:10	RO	<b>Organizationally Unique Identifier Bits 19:24</b>
LDN	9:4	RO	<b>Device Number</b> Specifies the device number <sup>1)</sup> to distinguish between several products.
LDRN	3:0	RO	<b>Device Number</b> Specifies the device revision number <sup>1)</sup> to distinguish between several versions of this device

1) For the device specific reset value, refer to Product Naming table in the [Package Outline](#) chapter.

**PMA/PMD speed ability (Register 1.4)**

IEEE Standard Register=1.4

**PMA\_SPEED\_ABILITY**
**Reset Value**
**PMA/PMD speed ability (Register 1.4)**

**MULTIGBASE-T status (Register 1.129)**

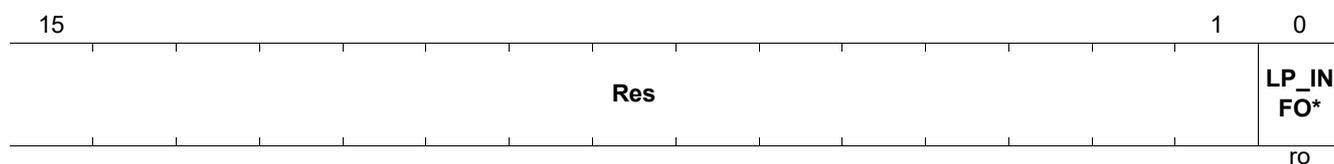

IEEE Standard Register=1.129

Indicates startup in 126.4.2.5 for 2.5G has been completed

When read as a 1, indicates that the startup protocol defined in 126.4.2.5 (for 2.5G/5GBASE-T) has been completed (link\_status=OK, pcs\_status = OK), and that the contents of bits 1.130.11:0 (Polarity), 1.131.15:10 (PBO), 1.145.14:8 (Skew), 1.146.14:8, and 1.146.6:0 (Skew), which are established during the startup protocol, are valid.

When read as a zero, bit 1.129.0 indicates that the startup process has not been completed, and that the contents of these bits that are established during the startup protocol are invalid. A PMA will return a value of zero in bit 1.129.1 if PMA link\_status=FAIL.

Field	Bits	Type	Description
MINMARGIN_A	15:0	RO	<b>MINMARGIN_A</b> Lowest value observed in the SNR operating margin channel A register (1.133) since the last read

**MULTIGBASE-T SNR Min Margin Channel B (Register 1.138)**

The minimum margin channel A register contains a latched copy of the lowest value observed in the SNR operating margin channel B register (1.134) since the last read.

IEEE Standard Register=1.138

**PMA\_MGBT\_MINMARGIN\_B**

**Reset Value**

**MULTIGBASE-T SNR Min Margin Channel B (Register 1.138)**

**0000<sub>H</sub>**

Field	Bits	Type	Description
MINMARGIN_B	15:0	RO	<b>MINMARGIN_B</b> Lowest value observed in the SNR operating margin channel B register (1.134) since the last read

**MULTIGBASE-T SNR Min Margin Chan C (Register 1.139)**

The minimum margin channel C register contains a latched copy of the lowest value observed in the SNR operating margin channel C register (1.135) since the last read.

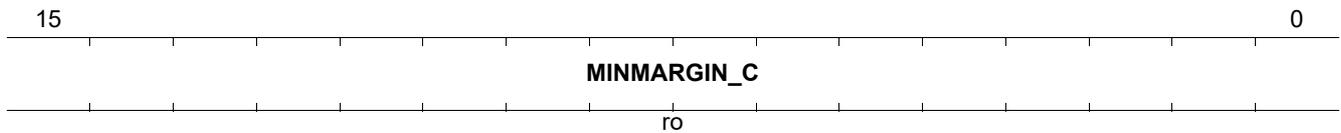

IEEE Standard Register=1.139

**PMA\_MGBT\_MINMARGIN\_C**

**Reset Value**

**MULTIGBASE-T SNR Min Margin Chan C (Register 1.139)**

**0000<sub>H</sub>**

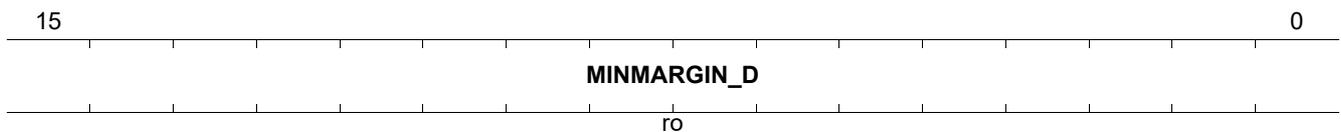

Field	Bits	Type	Description
MINMARGIN_C	15:0	RO	<b>MINMARGIN_C</b> Lowest value observed in the SNR operating margin channel C register (1.135) since the last read

#### MULTIGBASE-T SNR Min Margin Chan D (Register 1.140)

The Minimum margin channel D register contains a latched copy of the lowest value observed in the SNR operating margin channel D register (1.136) since the last read.

IEEE Standard Register=1.140

**PMA\_MGBT\_MINMARGIN\_D** **Reset Value**  
**MULTIGBASE-T SNR Min Margin Chan D (Register 1.140)** **0000<sub>H</sub>**

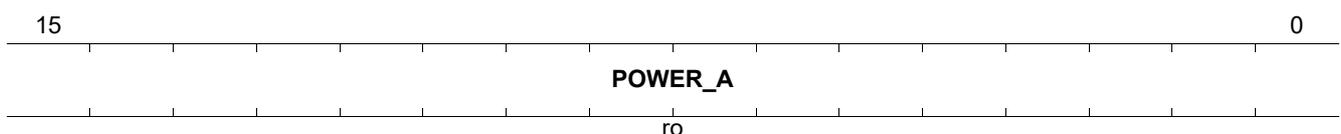

Field	Bits	Type	Description
MINMARGIN_D	15:0	RO	<b>MINMARGIN_D</b> Lowest value observed in the SNR operating margin channel D register (1.136) since the last read

#### MULTIGBASE-T Rx Power Channel A (Register 1.141)

The RX signal power channel A register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.141

**PMA\_MGBT\_POWER\_A** **Reset Value**  
**MULTIGBASE-T Rx Power Channel A (Register 1.141)** **0000<sub>H</sub>**

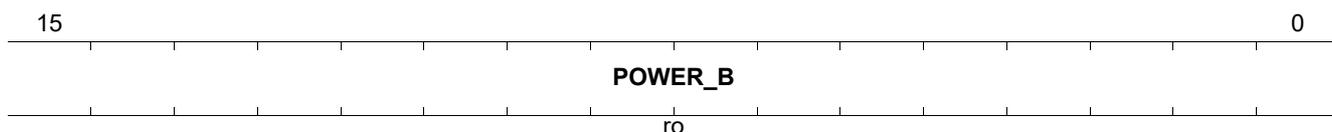

Field	Bits	Type	Description
POWER_A	15:0	RO	<b>POWER_A</b> Receive signal power measured at the MDI during training

**MULTIGBASE-T Rx Power Channel B (Register 1.142)**

The RX signal power channel B register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.142

**PMA\_MGBT\_POWER\_B** **Reset Value**  
**MULTIGBASE-T Rx Power Channel B (Register 1.142)** **0000<sub>H</sub>**

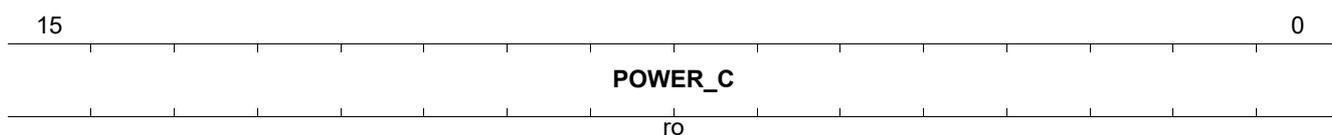

Field	Bits	Type	Description
POWER_B	15:0	RO	<b>POWER_B</b> Receive signal power measured at the MDI during training

**MULTIGBASE-T Rx Power Chan C (Register 1.143)**

The RX signal power channel C register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.143

**PMA\_MGBT\_POWER\_C** **Reset Value**  
**MULTIGBASE-T Rx Power Chan C (Register 1.143)** **0000<sub>H</sub>**

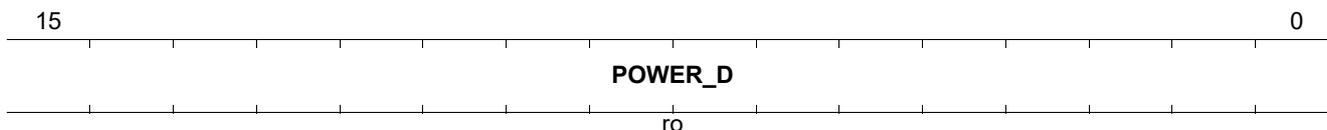

Field	Bits	Type	Description
POWER_C	15:0	RO	<b>POWER_C</b> Receive signal power measured at the MDI during training

**MULTIGBASE-T Rx Power Chan D (Register 1.144)**

The RX signal power channel D register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.144

**PMA\_MGBT\_POWER\_D** **Reset Value**  
**MULTIGBASE-T Rx Power Chan D (Register 1.144)** **0000<sub>H</sub>**

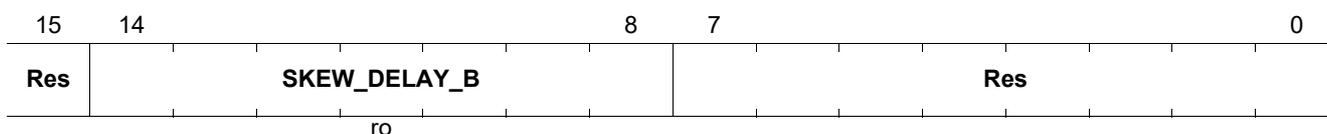

Field	Bits	Type	Description
POWER_D	15:0	RO	<b>POWER_D</b> Receive signal power measured at the MDI during training

**MULTIGBASE-T skew delay 0 (Register 1.145)**

IEEE Standard Register=1.145

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. If the delay exceeds the maximum amount that can be represented by the range (-80 ns to +78.75 ns), the field displays the maximum value.

**PMA\_MGBT\_SKEW\_DELAY\_0** **Reset Value**  
**MULTIGBASE-T skew delay 0 (Register 1.145)** **0000<sub>H</sub>**

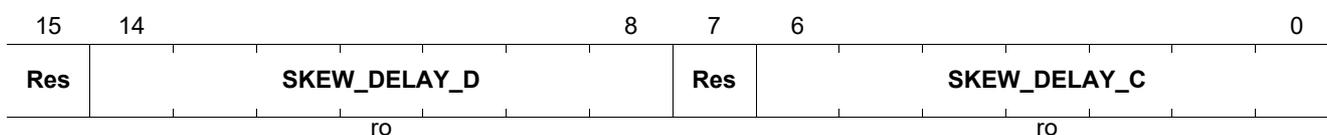

Field	Bits	Type	Description
SKEW_DELAY_B	14:8	RO	<b>Skew delay B</b> Skew delay for pair B

**MULTIGBASE-T skew delay 1 (Register 1.146)**

IEEE Standard Register=1.146

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. If the delay exceeds the maximum amount that can be represented by the range (-80 ns to +78.75 ns), the field displays the maximum value.

**PMA\_MGBT\_SKEW\_DELAY\_1** **Reset Value**  
**MULTIGBASE-T skew delay 1 (Register 1.146)** **0000<sub>H</sub>**

Field	Bits	Type	Description
SKEW_DELAY_D	14:8	RO	<b>Skew delay D</b> Skew delay for pair D
SKEW_DELAY_C	6:0	RO	<b>Skew delay C</b> Skew delay for pair C

**MULTIGBASE-T skew delay 2 (Register 1.147)**

IEEE Standard Register=1.147

**PMA\_MGBT\_FAST\_RETRAIN\_STA\_CTRL**

Reset Value

**MULTIGBASE-T skew delay 2 (Register 1.147)**

0000<sub>H</sub>

Field	Bits	Type	Description
LP_FAST_RETRAIN_COUNT	15:11	RO	<b>LP fast retrain count</b> Counts the number of fast retrains requested by the link partner
LD_FAST_RETRAIN_COUNT	10:6	RO	<b>LD fast retrain count</b> Counts the number of fast retrains requested by the local device
FAST_RETRAIN_ABILITY	4	RO	<b>Fast retrain ability</b> 1 = Fast retrain capability is supported 0 = Fast retrain capability is not supported
FAST_RETRAIN_NEGOTIATED	3	RO	<b>Fast retrain negotiated</b> 1 = Fast retrain capability was negotiated 0 = Fast retrain capability was not negotiated
FAST_RETRAIN_SIG_TYPE	2:1	RW	<b>Fast retrain signal type</b> 11 = Reserved 10 = PHY signals Link Interruption during fast retrain 01 = PHY signals Local Fault during fast retrain 00 = PHY signals IDLE during fast retrain

### 6.3.1 Standard Auto-Negotiation Registers for MMD=0x07

This chapter describes all registers of ANEG in detail.

#### Auto-Negotiation Control (Register 7.0)

The register controls the main function of Auto-Negotiation as defined in Clause 45. See IEEE 802.3 45.2.7.1.

This register mirrors register STD\_CTRL from Clause 22.

IEEE Standard Register=7.0

#### ANEG\_CTRL

15	14	13	12	11	10	9	8					0
<b>RST</b>	<b>RES3</b>	<b>XNP</b>	<b>ANEG_EN*</b>	<b>RES2</b>		<b>ANEG_RE*</b>	<b>RES1</b>					
RW	RO	RW	RW	RO		RW	RO					

Field	Bits	Type	Description
RST	15	RW	<b>Reset</b> Resets entire PHY to its default state. Active links are terminated. This is a self-clearing bit: GPY firmware sets it to zero by the hardware after reset is completed. 0 <sub>B</sub> <b>NORMAL</b> GPY Normal Operation 1 <sub>B</sub> <b>RESET</b> GPY Reset
RES3	14	RO	<b>Reserved</b> Value always zero, writes ignored.
XNP	13	RW	<b>Extended Next Page Control</b> 0 <sub>B</sub> <b>ZERO</b> Extended Next Page is disabled 1 <sub>B</sub> <b>ONE</b> Extended Next Page is enabled
ANEG_ENAB	12	RW	<b>Auto-Negotiation Enable</b> Enable the Auto-Negotiation process to determine the link configuration. Bit 7.0.12 is a copy of bit 0.12 in register 0 (STD_CTRL) (see 22.2.4.1.4). 0 <sub>B</sub> <b>ZERO</b> disable auto-negotiation process 1 <sub>B</sub> <b>ONE</b> enable auto-negotiation process
RES2	11:10	RO	<b>Reserved</b> Value always zero, writes ignored.
ANEG_RESTART	9	RW	<b>Restart Auto-Negotiation</b> The Auto-Negotiation process is restarted by setting bit 7.0.9 to one. Bit 7.0.9 is a mirror of bit 0.9 in register 0 (STD_CTRL) (see IEEE 802.3 22.2.4.1.7). Completion of ANEG is indicated in bit 0.1.5 and 7.1.5. 0 <sub>B</sub> <b>ZERO</b> Normal Operation 1 <sub>B</sub> <b>RESTART</b> Restart Auto-Negotiation process
RES1	8:0	RO	<b>Reserved</b> Value always zero, writes ignored

Field	Bits	Type	Description (cont'd)
ANEG_RF	4	ROSC	<b>Remote Fault</b> When read as one, bit 7.1.4 indicates that a remote fault condition has been detected. Bit 7.1.4 is a copy of bit 1.4 in register 1, device 0 (see 22.2.4). 0 <sub>B</sub> <b>NORMAL</b> No remote fault condition detected 1 <sub>B</sub> <b>FAULT</b> Remote fault condition detected
ANEG_ABLE	3	RO	<b>Auto-Negotiation Ability</b> Bit 7.1.3 is a copy of bit 1.3 in register 1 (see 22.2.4). This is the ANEG ability of the GPY. 0 <sub>B</sub> <b>UNABLE</b> PHY is not able to perform Auto-Negotiation 1 <sub>B</sub> <b>ABLE</b> PHY is able to perform Auto-Negotiation
LINKSTA	2	RO	<b>Link Status</b> When read as a one, bit 7.1.2 indicates that the PMA/PMD has determined that a valid link has been established. This bit is a duplicate of the PMA/PMD link status bit in 1.1.2. This bit latches low, so does not represent the current status but can be used to indicate link drop since the last read from the management interface. Reading this bit from MDIO resets the bit to the current value of the link. 0 <sub>B</sub> <b>DOWN</b> Link is down 1 <sub>B</sub> <b>UP</b> Link is Up
RES1	1	RO	<b>Value always zero, write ignored</b>
LP_ANEG_ABLE	0	RO	<b>Link partner auto-negotiation ability</b> 0 <sub>B</sub> <b>UNABLE</b> Link partner is not capable of auto-negotiation. 1 <sub>B</sub> <b>ABLE</b> Link partner is capable of auto-negotiation

### ANEG Adv. for GPY (Register 7.16)

This register is a copy of the Auto-Negotiation advertisement register (Register 4). A read to the AN advertisement register (7.16) reports the value of the Auto-Negotiation advertisement register (Register 4); writes to the AN advertisement register (7.16) cause a write to occur to the Auto-Negotiation advertisement register (Register 4).  
IEEE Standard Register=7.16

### 6.4.1 Vendor Specific 1 Device for MMD=0x1E

This section describes all registers of VSPEC1 in detail.

#### Configuration for LED Pin 0 (Register 30.1)

This register configures the behavior of the LED0 depending on pre-defined states or events the PHY has entered into or raised. Since more than one event/state can be active at the same time, more than one function might apply simultaneously. The priority from highest to lowest is given by the order PULSE, BLINKS, BLINKF, CON.

IEEE Standard Register=30.1

Field	Bits	Type	Description
BLINKS	15:12	RW	<p><b>Slow Blinking Configuration</b></p> <p>The Blink-S field selects in which PHY states the LED blinks with the pre-defined slow frequency. Each bit mask indicates a link speed. Combinations of the bit mask below can be used to provide a combination of link speed states to enable the behavior.</p> <p>0000<sub>B</sub><b>NONE</b> Not Active            0001<sub>B</sub><b>LINK10</b> Blink when Link is 10 Mbit/s            0010<sub>B</sub><b>LINK100</b> Blink when Link is 100 Mbit/s            0100<sub>B</sub><b>LINK1000</b> Blink when Link is 1000 Mbit/s            1000<sub>B</sub><b>LINK2500</b> Blink when Link is 2500 Mbit/s</p>
PULSE	11:8	RW	<p><b>Pulsing Configuration</b></p> <p>The pulse field is a mask field in which certain events can be combined, e.g. TXACT RXACT, to generate a pulse on the LED when such an event is detected.</p> <p>0000<sub>B</sub><b>NONE</b> No pulsing            0001<sub>B</sub><b>TXACT</b> Transmit activity            0010<sub>B</sub><b>RXACT</b> Receive activity            0100<sub>B</sub><b>COL</b> Collision            1000<sub>B</sub><b>NO_CON</b> Constant ON behavior is switched off</p>
CON	7:4	RW	<p><b>Constant On Configuration</b></p> <p>The Constant-ON field selects in which PHY states the LED is constantly on. Each bit mask indicates a link speed. Combinations of the bit mask below can be used to provide a combination of link speed states to enable the behavior.</p> <p>0000<sub>B</sub><b>NONE</b> Not Active            0001<sub>B</sub><b>LINK10</b> On when Link is 10 Mbit/s            0010<sub>B</sub><b>LINK100</b> On when Link is 100 Mbit/s            0100<sub>B</sub><b>LINK1000</b> On when Link is 1000 Mbit/s            1000<sub>B</sub><b>LINK2500</b> On when Link is 2500 Mbit/s</p>
BLINKF	3:0	RW	<p><b>Fast Blinking Configuration</b></p> <p>The Blink-F Field selects in which PHY states the LED blinks with the pre-defined fast frequency. Each bit mask indicates a link speed. Combinations of the bit mask below can be used to provide a combination of link speed states to enable the behavior.</p> <p>0000<sub>B</sub><b>NONE</b> No Active            0001<sub>B</sub><b>LINK10</b> Blink when Link is 10 Mbit/s            0010<sub>B</sub><b>LINK100</b> Blink when Link is 100 Mbit/s            0100<sub>B</sub><b>LINK1000</b> Blink when Link is 1000 Mbit/s            1000<sub>B</sub><b>LINK2500</b> Blink when Link is 2500 Mbit/s</p>

## 7 Electrical Characteristics

This chapter defines the electrical characteristics of the MxL86211C.

**Attention: This document contains preliminary information and is not released.**  
**Technical specifications are subject to change without notice.**

### 7.1 Absolute Maximum Ratings

**Table 25** shows the absolute maximum ratings for the MxL86211C.

**Table 25 Absolute Maximum Ratings**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Storage Temperature Limits	$T_{STG}$	-55.0	–	125.0	°C	–
Soldering Temperature	$T_{SOL}$	–	–	260.0	°C	Compliance with Pb free re-flow soldering profile as J-STD-020D
Moisture Level 3 Temperature Limits	$T_{ML3}$	–	–	260.0	°C	According to IPS J-STD 020
Absolute Junction Temperature	$T_{JABS}$	0		125	°C	Thermal solution must ensure that $T_J$ never exceeds $T_{JABS}$ . The chip resets the device when $T_J > T_{JABS}$ to prevent any damage to occur.
DC Voltage Limits on VDDP3V3 Pins	$V_{DDP3V3}$	-0.5	–	+3.63	V	$V_{HIGH}$ supply
DC Voltage Limits on VDDP Pin when the maximum voltage level of 3.3 V is used on MDC, MDIO, and MDINT pins	$V_{DDP}$	-0.5	–	+3.63	V	$V_{HIGH}$ supply
DC Voltage Limits on VDDP Pin when the maximum voltage level of 1.8 V is used on MDC, MDIO, and MDINT pins	$V_{DDP}$	-0.5	–	+1.98	V	1.8 V supply dedicated to MDIO pins in lower mode
DC Voltage Limits on VPH Pin	$V_{PH}$	-0.5	–	+3.63	V	$V_{HIGH}$ supply
DC Voltage Limits on VP Pin	$V_P$	-0.5	–	+1.05	V	$V_{LOW}$ supply
DC Voltage Limits on VDDA3V3 Pins	$V_{DDA3V3}$	-0.5	–	+3.63	V	$V_{HIGH}$ supply
DC Voltage Limits on VDDA3V3XO Pin	$V_{DDA3V3XO}$	-0.5	–	+3.63	V	$V_{HIGH}$ supply
DC Voltage Limits on VDDA0V9 Pins	$V_{DDA0V9}$	-0.5	–	+1.05	V	$V_{LOW}$ supply
DC Voltage Limits on VDD Pins	$V_{DD}$	-0.5	–	+1.05	V	$V_{LOW}$ supply

Electrical Characteristics

**Table 25 Absolute Maximum Ratings** (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
ESD HBM Robustness	$V_{ESD,HBM}$	–	–	1000.0	V	According to ANSI/ESDA/JEDEC JS-001-2014
ESD CDM Robustness	$V_{ESD,CDM}$	–	–	250.0	V	According to ANSI/ESDA/JEDEC JS-002-2014

**Attention:** Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

## 7.2 Operating Range

**Table 26** defines the maximum values of voltages and temperature that must be applied to guarantee proper operation of the MxL86211C. The values are relative to a ground voltage  $V_{SS}$  of 0.0 V.

**Table 26 Operating Range**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Ambient Temperature	$T_A$	0	–	70	°C	The device can operate in an ambient temperature of up to 85°C, when it is ensured that the maximum junction temperature ( $T_j$ ) of 110°C is not exceeded.
Junction Temperature	$T_j$	–	–	110	°C	Thermal solution must ensure that $T_j$ remains within operating range and never exceed maximum absolute ratings.
Multi Voltage Pin Supply Voltage for MDIO signals when the maximum voltage level of 1.8 V is used on MDC, MDIO, and MDINT pins	$V_{DDP}$	1.71	1.8	1.89	V	1.8 V supply dedicated to MDIO pins in lower mode
Multi Voltage Pin Supply Voltage for MDIO signals when the maximum voltage level of 3.3 V is used on MDC, MDIO, and MDINT pins	$V_{DDP}$	3.135	3.30	3.46	V	$V_{HIGH}$ supply
Pin Supply Voltage for non-MDIO signals	$V_{DDP3V3}$	3.13	3.30	3.46	V	$V_{HIGH}$ supply
Analog High Supply Voltage	$V_{DDA3V3}$	3.13	3.30	3.46	V	$V_{HIGH}$ supply
XO High Supply Voltage	$V_{DDA3V3XO}$	3.13	3.30	3.46	V	$V_{HIGH}$ supply
SGMII High Supply Voltage	$V_{PH}$	3.13	3.30	3.46	V	$V_{HIGH}$ supply
Analog Low Supply Voltage	$V_{DDA0V9}$	0.94	0.97	1.00	V	$V_{LOW}$ supply
SGMII Low Supply Voltage	$V_P$	0.94	0.97	1.00	V	$V_{LOW}$ supply
Core Digital Supply Voltage	$V_{DD}$	0.94	0.97	1.00	V	$V_{LOW}$ supply
Digital Input Voltage	$V_{ID}$	-0.30	–	$V_{DDP3V3}+0.3$	V	–

**Attention: Operations above the max. values listed here for extended periods can adversely affect long-term reliability of the device.**

### 7.3 Chip Power Consumption

**Table 27** lists the typical power consumption for different modes. Typical power is the power consumed by a nominal process device, nominal supply voltages, at 25°C ambient temperature and a CAT5e link segment.

The Link-up conditions are full-speed, bidirectional, full-duplex.

**Table 27 Typical Power Consumption**

	3.3 V $V_{HIGH}$ Domain Current	0.97 V $V_{LOW}$ Domain Current	Chip Power
Unit	mA	mA	W
2500BASE-T Link-Up, 100 m cable	105	452	0.78
2500BASE-T Link-Up, 30 m cable	103	412	0.74
2500BASE-T EEE	98	284	0.60
1000BASE-T Link-Up, 100 m cable	77	230	0.48
1000BASE-T EEE	30	125	0.22
100BASE-TX Link-Up, 100 m cable	45	100	0.25
100BASE-TX EEE	29	90	0.18
10BASE-Te Link-Up, 100 m cable	34	84	0.19
Cable Unplugged - ANEG	37	95	0.21
Cable Unplugged - LP	15	18	0.07
Reset	4	8	0.02

### 7.4 Maximum Thermal Design Power

**Table 2** lists the maximum Thermal Design Power (TDP). The TDP is the power consumption for a full traffic load and worst-case process, supply voltage, cable, and temperature conditions. This value is relevant to design the thermal solution.

**Table 28 Maximum Power Consumption**

	Maximum Power
Unit	W
Maximum Chip Power at Maximum Operating Range	1.33

*Note: With a properly designed thermal solution (heat sink), it is unlikely that  $T_j$  exceeds the maximum operating junction temperature. An excess is reported in the MDIO register VSPEC1\_TEMP\_STA and the STA can initiate a renegotiation to a lower link rate to get  $T_j$  back into the operating temperature range if ADS is disabled.*

### 7.5 Maximum Current

**Table 29** provides the maximum current to dimension the power supply. It is the maximum current consumption per rail for a full traffic load and worst-case process, supply voltage and temperature conditions that may occur in any operating state of the device. The maximum current can be higher than the steady state current, for instance in training phases of the internal filters.

**Table 29 Maximum Current Per Rail**

<b>3.3 V V<sub>HIGH</sub> Domain Current</b>	<b>0.97 V V<sub>LOW</sub> Domain Current</b>
<b>mA</b>	<b>mA</b>
124	1265

## 7.6 DC Characteristics

The following sections describe the DC characteristics of the MxL86211C external interfaces.

### 7.6.1 Digital Interfaces

This chapter defines the DC characteristics of the GPIO interfaces as follows:

- MDIO
- Interrupts
- Clock Outputs
- General Purpose IO
- LED
- HRSTN
- DVS

The DC characteristics for  $V_{DDP3V3}=3.3V$  and  $V_{DDP}=3.3 V$  are summarized in [Table 30](#).

**Table 30 DC Characteristics of the GPIO Interfaces ( $V_{DDP3V3} = 3.3 V$ ,  $V_{DDP} = 3.3 V$ )**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	2	–	$V_{DDP}+0.3$	V	–
Input Low Voltage	$V_{IL}$	–0.3	–	0.8	V	–
Output High Voltage	$V_{OH}$	$V_{DDP}-0.4$	–	–	V	$I_{OH}= 2, 4, 8, 12 \text{ mA}$
Output Low Voltage	$V_{OL}$	–	–	0.4	V	$I_{OL}= 2, 4, 8, 12 \text{ mA}$

The DC characteristics for  $V_{DDP}=1.8 V$  are summarized in [Table 31](#).

**Table 31 DC Characteristics of the GPIO Interfaces ( $V_{DDP} = 1.8 V$ )**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	$0.65 \cdot V_{DDP}$	–	$V_{DDP}+0.3$	V	–
Input Low Voltage	$V_{IL}$	–0.3	–	$0.35 \cdot V_{DDP}$	V	–
Output High Voltage	$V_{OH}$	$V_{DDP}-0.4$	–	–	V	$I_{OH}= 2, 4, 8, 12 \text{ mA}$
Output Low Voltage	$V_{OL}$	–	–	0.4	V	$I_{OL}= 2, 4, 8, 12 \text{ mA}$

### 7.6.2 Twisted Pair Interface

The TPI conforms to the specifications of 10BASE-T (Clause 14), 100BASE-TX (Clause 25), 1000BASE-T (Clause 40) and 2.5GBASE-T (Clause 126) given in IEEE 802.3, as well as ANSI X3.263-1995.

### 7.6.3 Built-in Temperature Sensor

**Table 32** gives the parameters of the integrated temperature sensor, measuring junction temperature  $T_j$ .

**Table 32** Temperature Sensor Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Temperature Range	$T_{\text{range}}$	-10		125	°C	Thermal Mitigation measures must ensure that $T_j$ remains within operating range. If $T_j$ exceeds Maximum Ratings, the GPY performs a self-reset to prevent damage, and the next ANEG is re-started advertising a lower speed.
Resolution		–	10	–	bits	–
Accuracy		-5	–	+5	°C	–

## 7.7 AC Characteristics

The following sections describe the AC characteristics of the external interfaces.

### 7.7.1 Power Up Sequence

The High Voltage domain  $V_{HIGH}$  must always be at a higher voltage level, than the Low Voltage Domain  $V_{LOW}$ . When  $V_{DDP}$  is at 1.8 V,  $V_{HIGH}$  must always be at a higher voltage than  $V_{DDP}$  and  $V_{DDP}$  must always be at a higher voltage than the Low Voltage Domain  $V_{LOW}$ .

$V_{HIGH}$ ,  $V_{DDP}^{1)}$  and  $V_{LOW}$  ramp-up times ( $t_{vh\_rampup}$ ,  $t_{vddp\_rampup}^{1)}$  and  $t_{vl\_rampup}$ ) must be above the minimum requirement.

All the supply domains  $V_{HIGH}$ ,  $V_{DDP}^{1)}$  and  $V_{LOW}$  must be stabilized before releasing the reset HRSTN.

The device reset HRSTN must be held for a  $t_{reset}$  time after the stabilization of the power supplies and pin strap values. When reset is released, the integrated PLL locks and the device boots up.

The MxL86211C supports an asynchronous hardware reset HRSTN. The timing requirements of the power supply pins are listed in [Table 33](#). The timings refer to the signal sequence waveforms depicted in [Figure 16](#) when  $V_{DDP}=3.3$  V and [Figure 17](#) when  $V_{DDP}=1.8$  V.

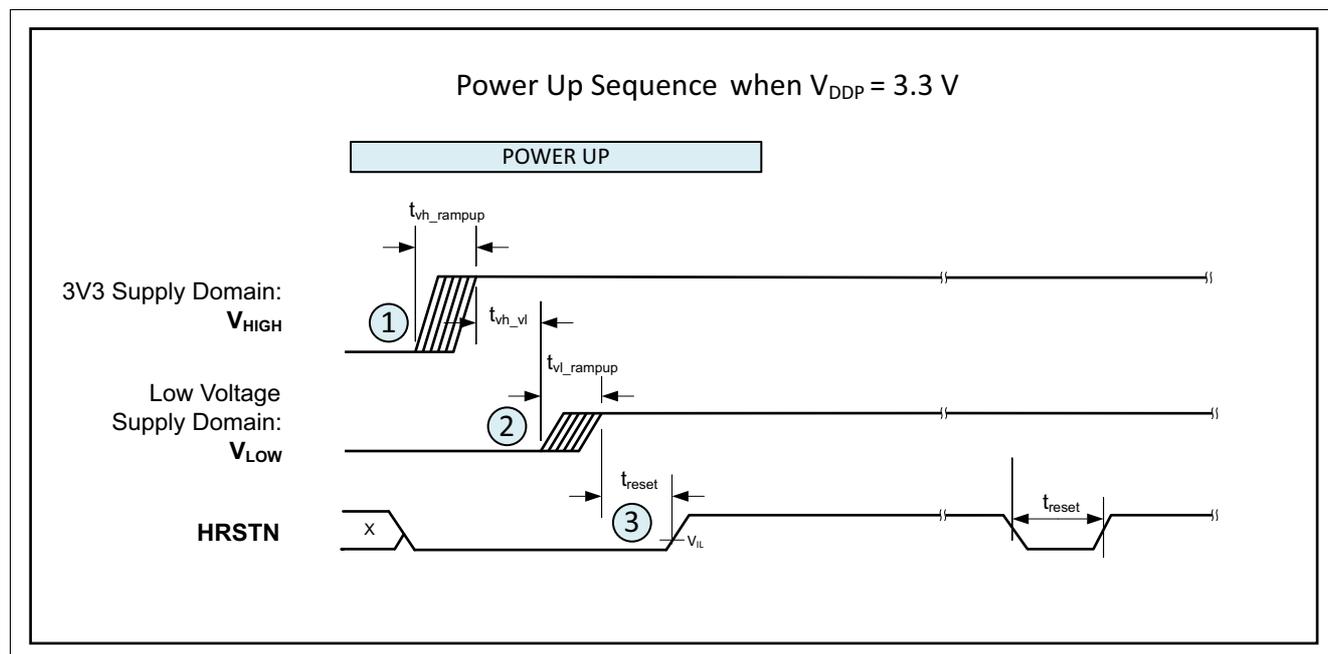

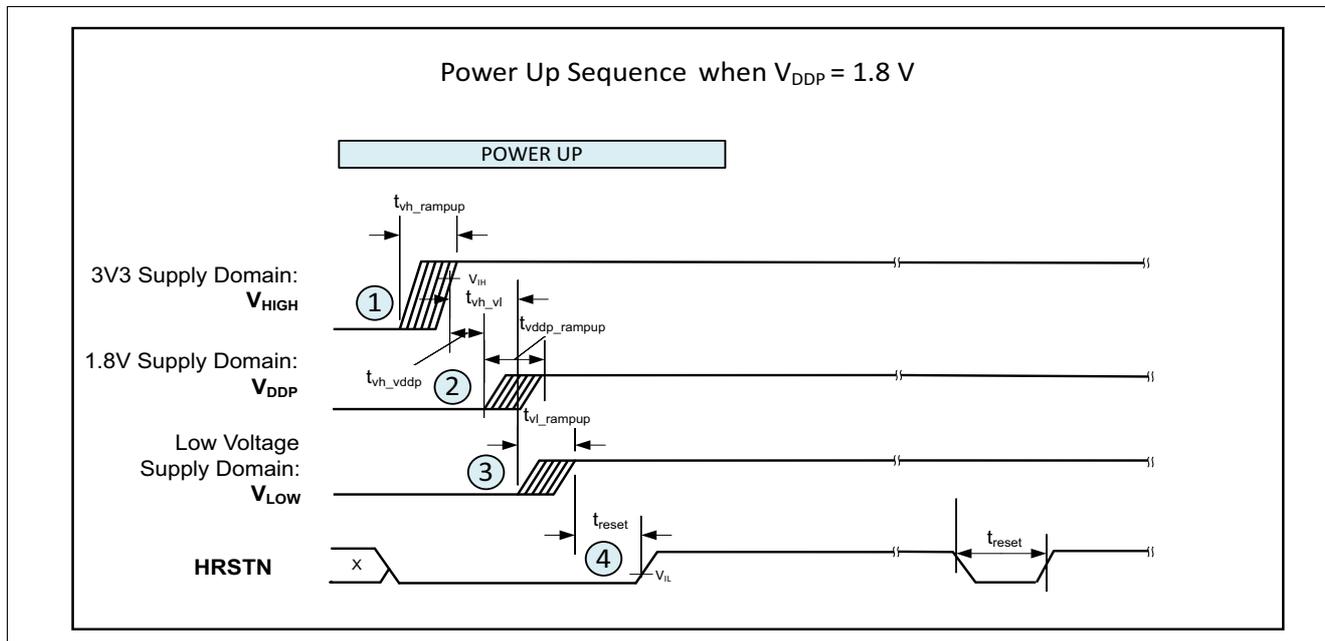

Figure 16 Timing Diagram for the Reset Sequence when  $V_{DDP} = 3.3$  V

**Figure 17** Timing Diagram for the Reset Sequence when  $V_{DDP} = 1.8\text{ V}$ 
**Table 33** Power Supply Timings (External supply of  $V_{LOW}$  domain)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
$V_{HIGH}$ domain ramp up	$t_{vh\_rampup}$	50	–	–	$\mu\text{s}$	
$V_{DDP}^{(1)}$ domain ramp up	$t_{vddp\_rampup}$	50	–	–	$\mu\text{s}$	
$V_{LOW}$ domain ramp up	$t_{vl\_rampup}$	50	–	–	$\mu\text{s}$	
Delay between $V_{HIGH}$ and $V_{LOW}$ domains voltage ramp up	$t_{vh\_vl}$	100	–	–	$\mu\text{s}$	The $V_{LOW}$ voltage must never be higher than $V_{HIGH}$ voltage
Delay between $V_{HIGH}$ and $V_{DDP}^{(1)}$ domains voltage ramp up	$t_{vh\_vddp}$	50	–	–	$\mu\text{s}$	The $V_{DDP}$ voltage must never be higher than $V_{HIGH}$ voltage.
Reset time after $V_{HIGH}$ and $V_{LOW}$ domains are stabilized	$t_{reset}$	100	–	–	ns	HRSTN must be released after the power supplies have stabilized.

Rise and ramp down times are from 10% to 90% marks for  $V_{HIGH}$ ,  $V_{LOW}$  and HRSTN.

## 7.7.2 Power Supply Rail Requirements

**Table 34** lists the required characteristics of the power supplies.

**Table 34 AC Characteristics of the Power Supply**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Power Supply Ripple on VDDA0V9	$R_{VDDA0V9}$	–	–	40.0	mV	Peak to Peak value
Power Supply Ripple on VP	$R_{VP}$	–	–	40.0	mV	Peak to Peak value
Power Supply Ripple on VDD	$R_{VDD}$	–	–	40.0	mV	Peak to Peak value
Power Supply Ripple on VDDP	$R_{VDDP}$	–	–	100.0	mV	Peak to Peak value
Power Supply Ripple on VDDA3V3	$R_{VDDA3V3}$	–	–	100.0	mV	Peak to Peak value
Power Supply Ripple on VDDA3V3XO	$R_{VDDA3V3XO}$	–	–	100.0	mV	Peak to Peak value
Power Supply Ripple on VPH	$R_{VPH}$	–	–	100.0	mV	Peak to Peak value

## 7.7.3 Input Clock

**Table 35** lists the input clock requirements when not using a crystal, i.e., when an external reference clock is injected into the XTAL1 pin of the MxL86211C. The requirements include the nominal frequency, frequency deviation, duty cycle, and signal characteristics. When a crystal is applied to generate the reference clock using the integrated XO, the clock requirements stated here are met explicitly as long as the specification for the crystal is satisfied.

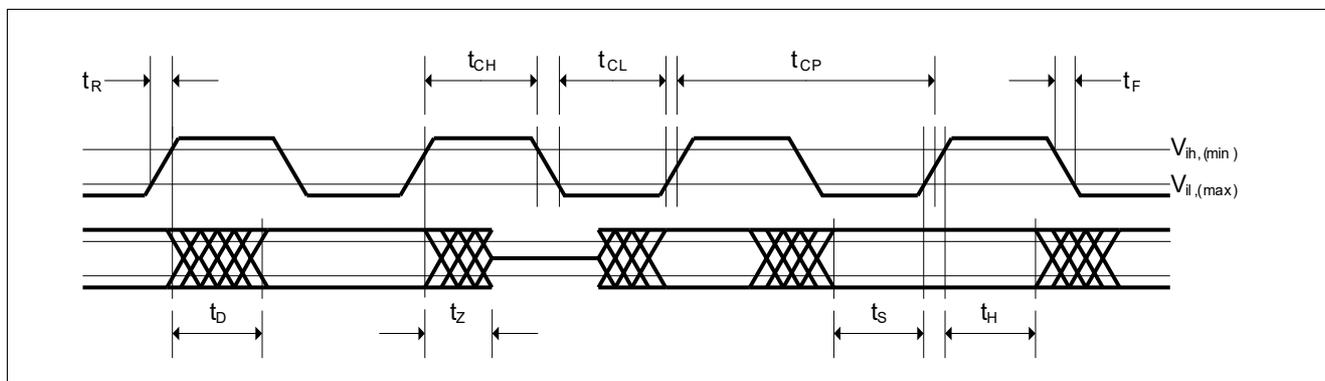

**Table 35 AC Characteristics of Input Clock on XTAL1 Pin**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz Input	$f_{clk25}$	–	25.0	–	MHz	–
Frequency Deviation <sup>1)</sup>		-50.0	–	+50.0	ppm	–
Duty Cycle		40.0	50.0	60.0	%	–
Rise/Fall Times		–	–	10.0	ns	–
Input Long Term Jitter (Jrms)		–	4.0	7.0	ps	1 kHz...10 MHz
Input High Voltage		0.6	–	2.0	V	–
Input Low Voltage		-0.3	–	0.2	V	–
Load Capacitance		–	15	–	pF	–

1) Including the frequency stability tolerance due to temperature, and aging effects over the product lifetime of 5 years.

### 7.7.4 MDIO Interface

**Figure 18** shows a timing diagram of the slave MDIO interface for a clock cycle in the read, write and turnaround modus. The timing measurements are annotated. The defined absolute values are summarized in **Table 36**.

**Figure 18** Timing Diagram for the MDIO Interface

**Table 36** Timing Characteristics of the MDIO Interface

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDC High Time	$t_{CH}$	10.0	–	–	ns	Given timings all refer to the MDC signal probed at the pin of the MxL86211C.
MDC Low Time	$t_{CL}$	10.0	–	–	ns	
MDC Clock Period	$t_{CP}$	40.0	400.0	–	ns	
MDC Clock Frequency <sup>1)</sup>	$t_{CP}$	–	2.5	25.0	MHz	
MDC Rise Time	$t_R$	–	–	5.0	ns	
MDC Fall Time	$t_F$	–	–	5.0	ns	
MDIO Input Setup Time	$t_S$	10.0	–	–	ns	MxL86211C Receive
MDIO Input Hold Time	$t_H$	10.0	–	–	ns	MxL86211C receive
MDIO Output Delay Time	$t_D$	0.0	–	10	ns	MxL86211C transmit
<b>Standard @2.5 MHz</b>						
MDIO Output Delay	$t_D$	0.0	–	300.0	ns	PHY transmit
MDIO Output Setup Time	$t_S$	10.0	–	–	ns	MAC transmit
MDIO Output Hold Time	$t_H$	10.0	–	–	ns	MAC transmit

1) MDC clock supports range of frequencies up to 25 MHz. Default/typical frequency is 2.5 MHz.

### 7.7.5 SGMII Interface

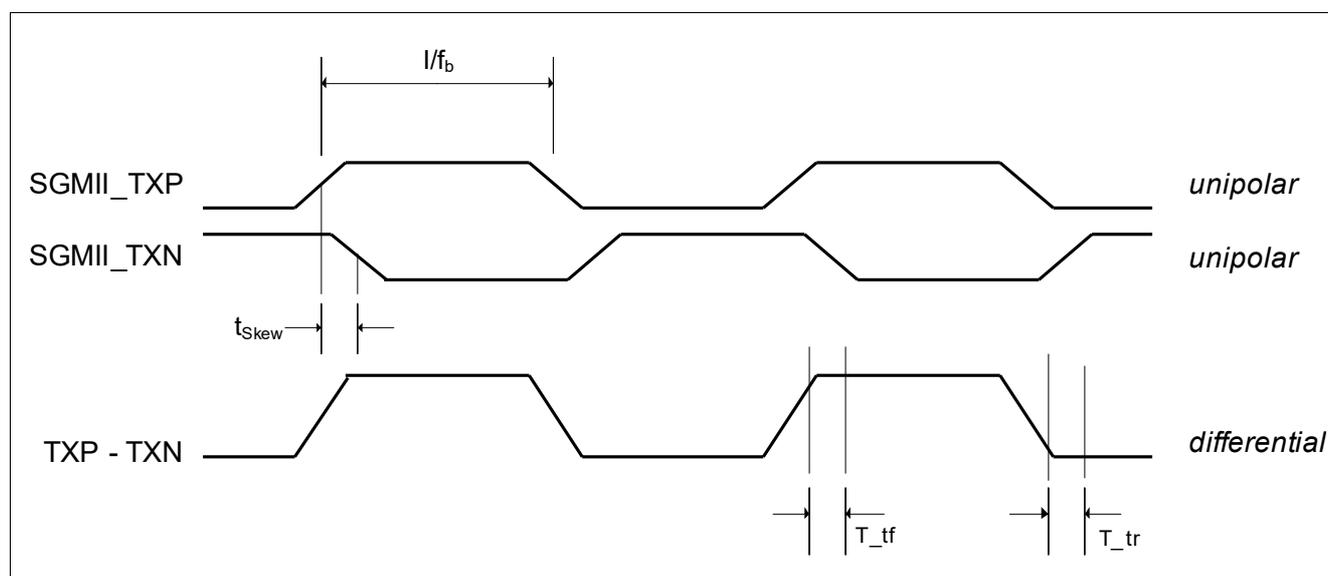

This section describes the AC characteristics of the SGMII Interface on the MxL86211C.

The SGMII Interface timing characteristics are described below:

- Transmit timing characteristics ([Chapter 7.7.5.1](#))
- Receive timing characteristics ([Chapter 7.7.5.2](#))

#### 7.7.5.1 Transmit Timing Characteristics

[Figure 19](#) shows the timing diagram of the transmit SGMII interface on the MxL86211C. It is referred to by [Table 37](#), which specifies the timing requirements.

**Figure 19** Transmit Timing Diagram of the SGMII (shows alternating data sequence)

**Table 37** Transmit Timing Characteristics of the SGMII

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Transmit baud rate	$f_b$	-100 ppm	$f_b$	+100 ppm	Mbaud	$f_b = 1.25/3.125$ Gbaud
Differential transmit rise time	$T_{tr}$	30 ps	–	0.25 UI	–	20%→80% <sup>1)</sup>
Differential transmit fall time	$T_{tf}$	30 ps	–	0.25 UI	–	80%→20%
Output timing jitter	$T_{TJ}$	–	–	0.30	UI <sub>pp</sub> <sup>2)</sup>	
Time skew between pairs	$t_{Skew}$	–	–	15	ps	–
Output differential voltage	$V_{OD}$	400	–	1600	mV	Peak-peak amplitude
Output impedance (differential)	$R_O$	80	100	120	$\Omega$	–

1) UI =  $1/f_b$ , Unit Interval.

2) Refer to [\[3\]](#) for details. The p-p (peak to peak) measurement states the maximum to minimum amount of time deviation.

### 7.7.5.2 Receive Timing Characteristics

Figure 20 shows the timing diagram of the receive SGMII interface of the MxL86211C. Refer to Table 38 for the timing requirements.

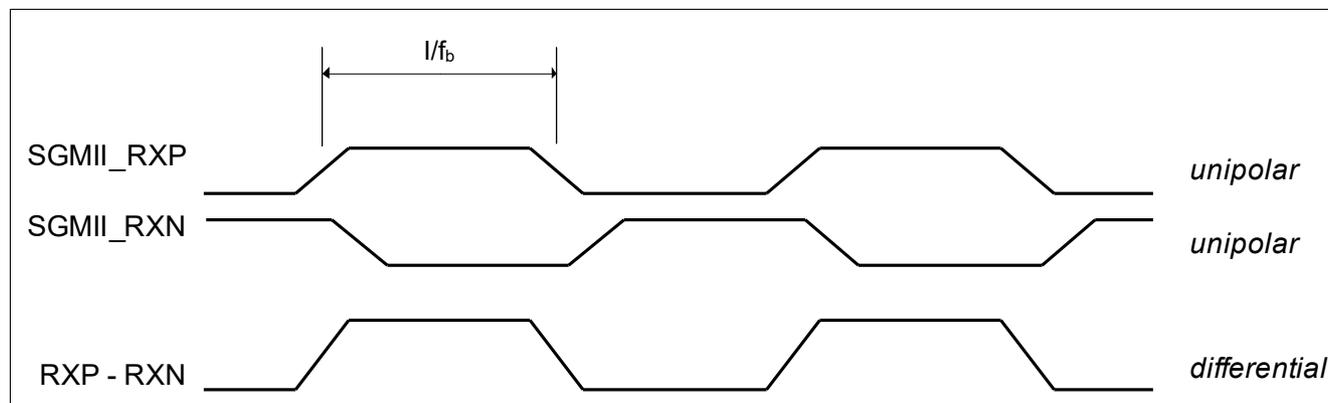

Figure 20 Receive Timing Diagram of the SGMII (alternating data input sequence)

Table 38 Receive Timing Characteristics of the SGMII

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Receive baud rate	$f_b$	-100 ppm	$f_b$	+100 ppm	Mbaud	$f_b = 1.25/3.125$ Gbaud
Receive data jitter tolerance	R_TJ	–	–	0.6	$UI_{pp}^{1)}$	–
Input differential voltage	$V_{ID}$	200	–	1600	mV	peak-peak amplitude
Input impedance (differential)	$R_I$	80	100	120	$\Omega$	–

1) Refer to [3] for details.

### 7.7.6 Crystal Specification

The 25 MHz crystal must follow the specification given in [Table 39](#).

**Table 39** Specification of the Crystal

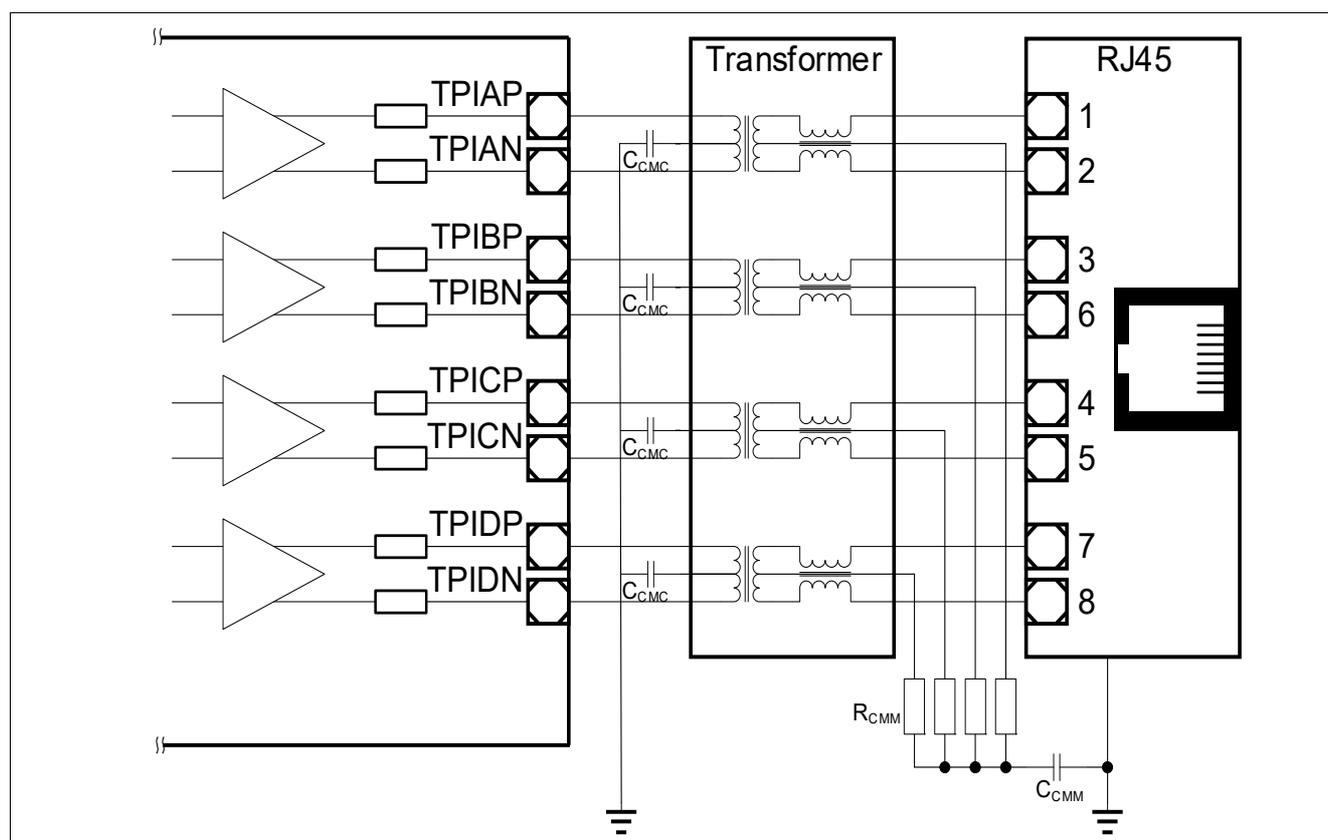

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz input	$f_{clk25}$	–	25.0	–	MHz	–
Total Frequency Stability	–	-50	–	+50	ppm	Refers to sum of all effects: e.g. general tolerance, aging, temperature dependency
Series Resonant Resistance	–	–	–	60	$\Omega$	–
Drive Level	–	–	–	0.1	mW	–
Load Capacitance	$C_L$	–	18	–	pF	–
Shunt Capacitance	$C_0$	–	–	5	pF	–

## 7.8 External Circuitry

This chapter specifies the component characteristics of the external circuitry connected to the MxL86211C.

### 7.8.1 Twisted-Pair Common-Mode Rejection and Termination Circuitry

This section describes the external circuitry that is required to properly terminate the common mode of the Twisted Pair Interface (TPI). These external components are also required to perform proper rejection of alien disturbers injected into the common mode of the TPI. **Figure 21** shows a typical external circuit, and in particular the common-mode components. **Table 40** defines the component values and their supported tolerances.

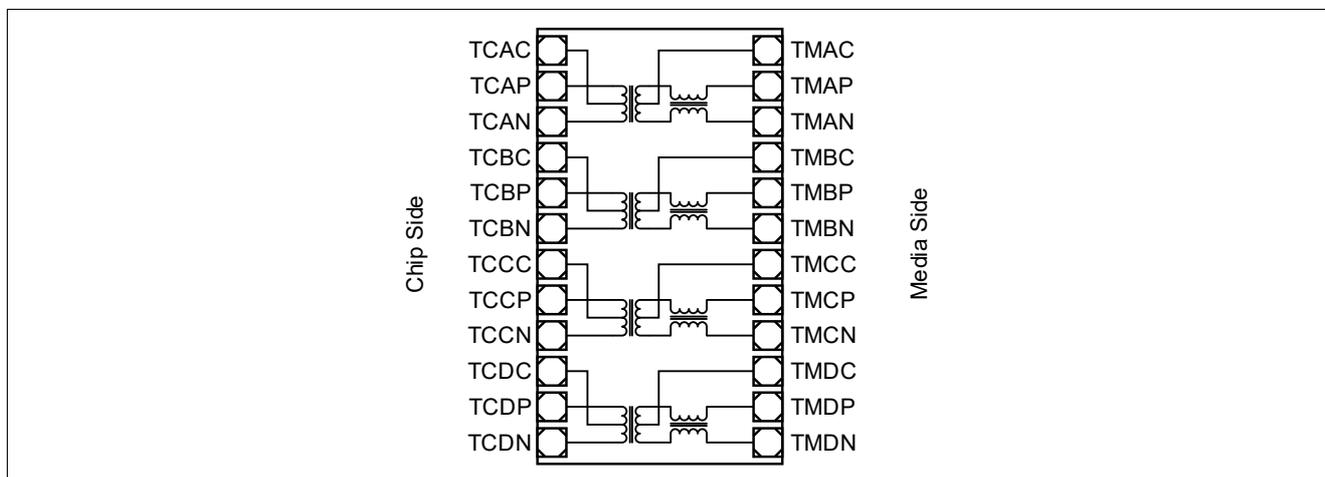

**Figure 21** Twisted Pair Common-Mode Rejection and Termination Circuitry

**Table 40** Electrical Characteristics for Common-Mode Rejection and Termination Circuitry

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Common-mode de-coupling capacitance (media end)	$C_{CMM}$	800	1000	1200	pF	±20%, 2 kV
Common-mode de-coupling capacitance (chip end)	$C_{CMC}$	80	100	120	nF	±20%, 2 kV
Common-mode termination resistance (media end)	$R_{CMM}$	67.5	75	82.5	Ω	±10%

### 7.8.2 Transformer (Magnetics)

This section specifies the required electrical characteristics of the transformer<sup>1)</sup> devices that are supported. The specifications listed here guarantee proper operation according to IEEE 802.3 [1].

**Figure 22 Schematic of an Ethernet Transformer Device**

A typical Gigabit Ethernet capable transformer device is depicted in **Figure 22**. **Table 41** lists the characteristics of the supported transformer devices. Note that these characteristics represent the minimum for achieving standard performance. Since the transformer significantly impacts the link performance, it is possible to increase the loop reach by selecting transformers with improved parameters.

**Table 41 Electrical Characteristics for Supported Transformers (Magnetics)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Turns Ratio	1:tr	0.95	1.00	1.05		±5%
Differential-to-common-mode rejection	DCMR	40	–	–	dB	30 MHz
		35	–	–	dB	60 MHz
		30	–	–	dB	100 MHz
Crosstalk attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 100 MHz
Insertion loss	IL	–	–	2	dB	100 MHz ≤ f ≤ 250 MHz
Return loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return loss	RL	16-10*log <sub>10</sub> (f/40)	–	–	dB	40 MHz ≤ f ≤ 125 MHz

1) Also often referred to as “magnetics”.

### 7.8.3 RJ45 Plug

**Table 42** describes the electrical characteristics of the RJ45 plug to be used in conjunction with the MxL86211C.

**Table 42 Electrical Characteristics for Supported RJ45 Plugs**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Crosstalk attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 250 MHz
Return loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return loss	RL	16-10*log10(f/40)	–	–	dB	40 MHz ≤ f ≤ 250 MHz

### 7.8.4 Calibration Resistors

An external resistor  $R_{RESREF}$  of 200 Ω 1% must be connected between the RESREF pin and ground to calibrate the MxL86211C SGMII analog modules.

The resistor values are indicated in **Table 43**.

**Table 43 Calibration Resistors Values**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SGMII PHY calibration resistor	$R_{RESREF}$	198	200	202	Ω	±1%

## 8 Package Outline

The product is assembled in a PG-VQFN-40 package, which complies with regulations requiring lead free material. The following parameters are generated in accordance with JEDEC JESD51 standards [4].

**Table 44 JEDEC Thermal Resistance Package Parameter**

Item	Name/Value
Environmental conditions	The chip is mounted on a 4-layer PCB (2S2P) according to JESD51-7 [4], PCB size 40 mm x 100 mm. Natural convection: still air, according to JESD51-2 [4] Ambient temperature: 70°C
Thermal Resistance - Junction to Ambient	$R_{th,JA} = 21.91 \text{ K/W}$
Thermal Resistance - Junction to Board	$R_{th,JB} = 6.0 \text{ K/W}$

The mechanical drawings for this package are shown in **Figure 23**. Dimensions are in millimeters.

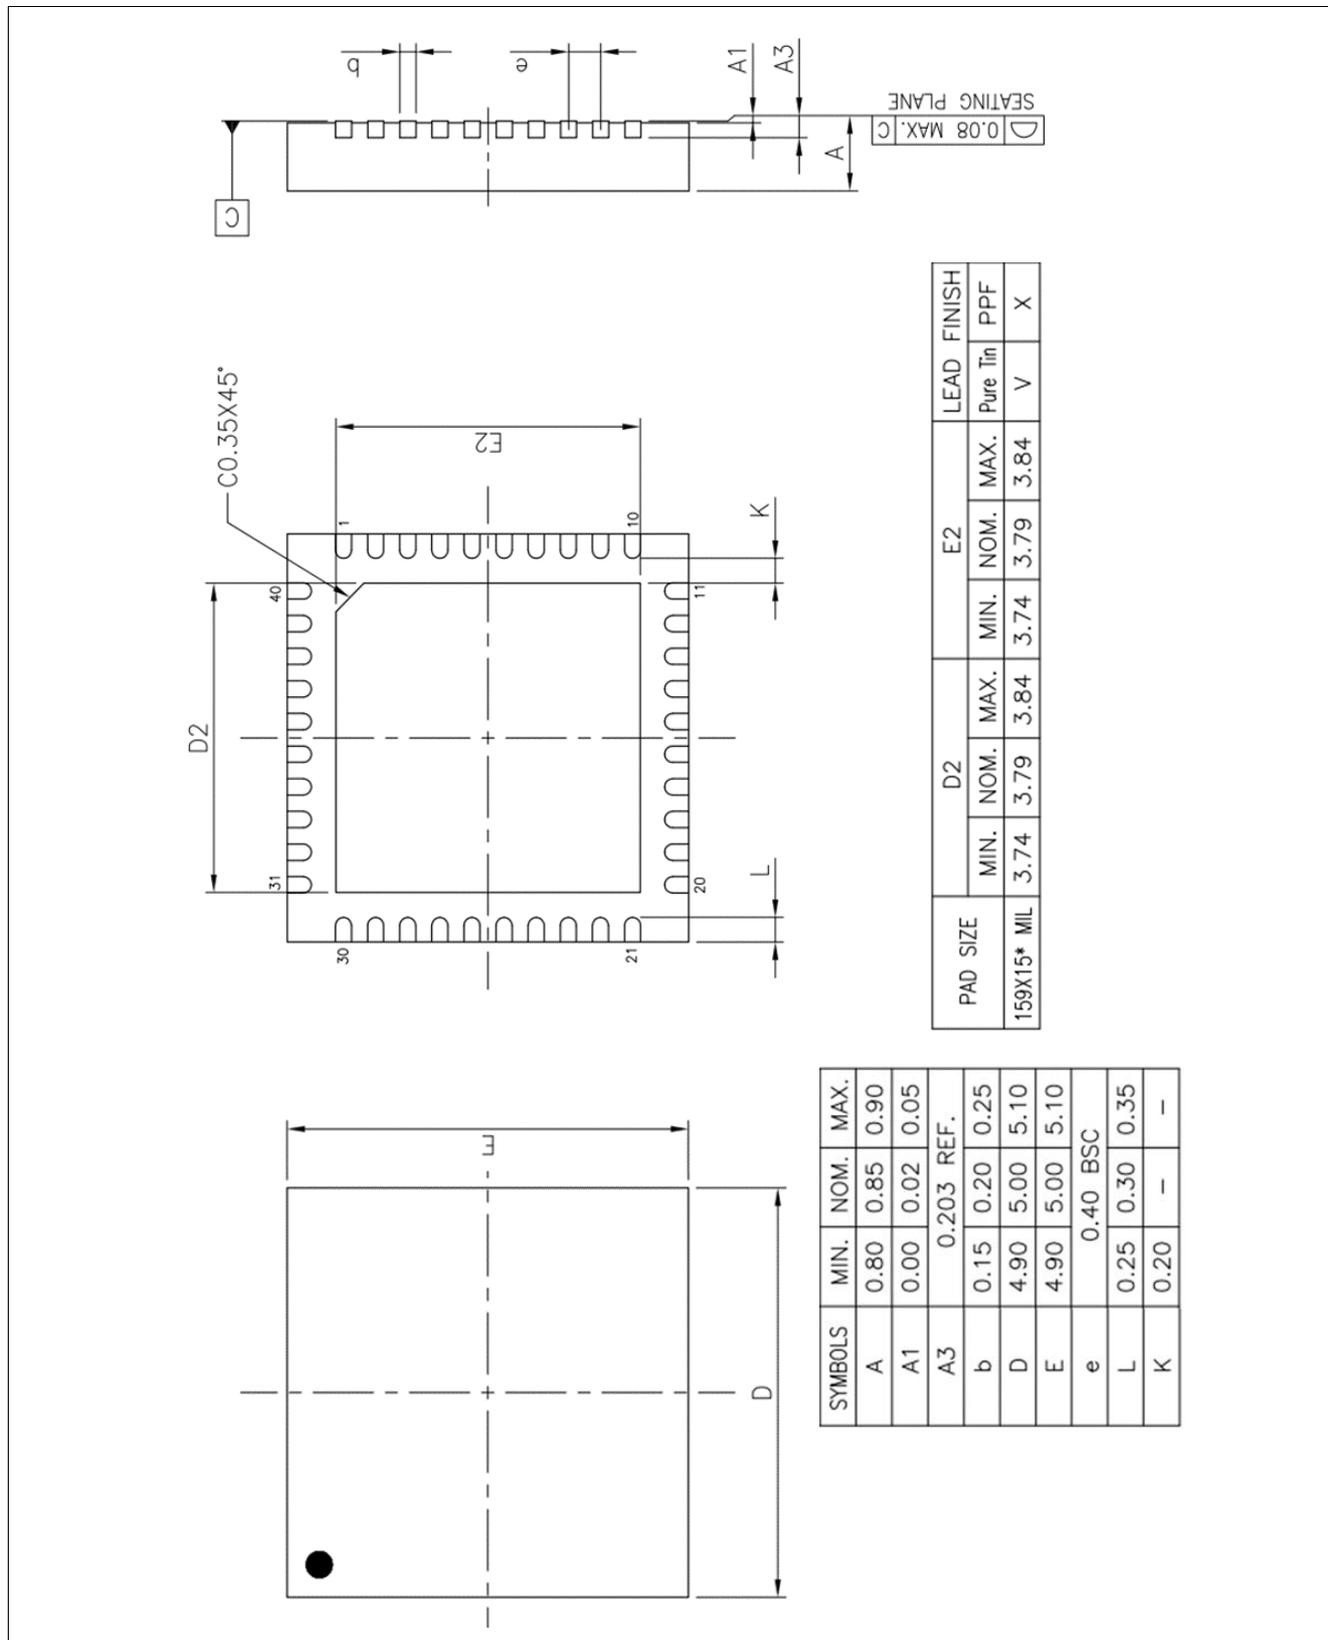

Figure 23 PG-VQFN-40 5 mm x 5 mm Package Outline

## 8.1 Ordering Information

**Table 45** describes the product, ordering, and packaging information for MxL86211C.

**Table 45 Product Naming**

Marketing Part Number	Ordering Part Number	Device Number <sup>1)</sup>	Device Revision Number <sup>2)</sup>	PHY Identifier <sup>3)</sup>
MxL86211C	MXL86211C-AQB-T	0x00	0x0	0x5400

- 1) LDN field in CL22 and CL45 registers
- 2) LDRN field in CL22 and CL45 registers
- 3) PHY Identifier 2 register 16-bit value

## Terminology

### A

ADS	Auto-Downspeed
ANEG	Auto-Negotiation
ANSI	American National Standards Institute

### B

BER	Bit Error Rate
BW	Bandwidth

### C

CAT5	Category 5 Cabling
CAT5e	Category 5 Enhanced Cabling
CDR	Clock and Data Recovery
CRC	Cyclic Redundancy Check

### D

DVS	Dynamic Voltage Scaling
-----	-------------------------

### E

EEE	Energy-Efficient Ethernet
EMI	Electromagnetic Interference
ESD	Electrostatic Discharge

### F

FLP	Fast Link Pulse
-----	-----------------

### G

GbE	Gigabit Ethernet
GPIO	General Purpose Input/Output

### H

HBM	Human Body Model
-----	------------------

### I

IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers

### J

JTAG	Jointed Test Action Group
------	---------------------------

### L

LAN	Local Area Network
LED	Light Emitting Diode
LPI	Low Power Idle
LSB	Least Significant Bit

### M

MAC	Media Access Controller
MDI	Media-Dependent Interface

MDIO	Management Data Input/Output
MDIX	Media-Dependent Interface Crossover
MII	Media-Independent Interface
MMD	MDIO Manageable Device
MSB	Most Significant Bit
<b>N</b>	
NLP	Normal Link Pulse
NP	Next Page
<b>O</b>	
OSI	Open Systems Interconnection
OUI	Organizationally Unique Identifier
<b>P</b>	
PCB	Printed Circuit Board
PCS	Physical Coding Sublayer
PD	Powered Device
PHY	Physical Layer (device)
PLL	Phase-Locked Loop
PMA	Physical Media Attachment
PSE	Power-Sourcing Equipment
PWM	Pulse Width Modulation
<b>R</b>	
RX	Receive
<b>S</b>	
SerDes	Serializer-Deserializer
SFD	Start-of-frame Delimiter
SGMII	Serial Gigabit Media-Independent Interface
SMD	Surface Mounted Device
SoC	System on Chip
STA	Station Management Entity (MAC SoC)
<b>T</b>	
TAP	Test Access Port
TPI	Twisted Pair Interface
TX	Transmit
<b>V</b>	
VQFN	Very Thin Quad Flat Non-leaded
<b>W</b>	
WoL	Wake-on-LAN
<b>X</b>	
xMII	Symbolic shortening which denotes the set of supported MII Interfaces, e.g. RGMII and SGMII
