

General Description

The XRT75R12 is a twelve channel, fully integrated Line Interface Unit (LIU) featuring MaxLinear's R³ Technology (Reconfigurable, Relayless Redundancy) for E3, DS3, and STS-1 applications. The LIU incorporates 12 independent receivers, transmitters and jitter attenuators in a single 420 lead TBGA package.

Each channel of the XRT75R12 can be independently configured to operate in E3 (34.368MHz), DS3 (44.736MHz) or STS-1 (51.84MHz). Each transmitter can be turned off and tri-stated for redundancy support or for conserving power.

The XRT75R12's differential receiver provides high noise interference margin and is able to receive data over 1000 feet of cable or with up to 12dB of cable attenuation.

Each channel of the XRT75R12 incorporates an advanced crystal-less jitter attenuator that can be selected either in the transmit or receive path. The jitter attenuator performance meets the ETSI TBR-24 and Bellcore GR-499 specifications.

The XRT75R12 provides a parallel microprocessor interface for programming and control.

The XRT75R12 supports analog, remote and digital loop-backs. The device also has a built-in Pseudo Random Binary Sequence (PRBS) generator and detector with the ability to insert and detect a single bit error for diagnostic purposes.

Applications

- E3 and DS3 access equipment
- DSLAMs
- Digital cross connect systems
- CSU and DSU equipment
- Routers
- Fiber optic terminals

Revision History

Document No.	Release Date	Change Description
1.0.0	05/10/05	Final Release Version of XRT75R12 datasheet.
1.0.1	April 2006	<ol style="list-style-type: none"> Added current and power consumption on Table 50, "DC Electrical Characteristics;" on page 84. Revised Receive Monitor Enable Bit functional description and Section 3.3.1 description. Updated Table 3, "The ALOS (Analog LOS) Declaration and Clearance Thresholds for a given setting of REQEN (DS3 and STS-1 Applications)," on page 23. Minor corrections on Transmitter Section of Features Summary on page 2. Minor typo corrections in STS1Clk/12M pin description and in Sections 1.0, 3.3, and 4.5, Table 17 and Table 19. Added Table 2, "Reference Clock Performance Specifications," on page 19.
1.0.2	12/07/06	<ol style="list-style-type: none"> Corrected package thermal resistance specification.
1.0.3	6/11/07	<ol style="list-style-type: none"> Corrected global register 0x08 and added global registers 0x80 & 0x88. Added (N = [0:11] & M = 0-5 & 8-D) to channelized register titles.
1.0.4	10/26/07	<ol style="list-style-type: none"> Theta-jC thermal value added.
1.0.5	03/24/15	<ol style="list-style-type: none"> Add "-L" to part number. Update Exar logo. Add technical support email address.
1.0.6	3/13/20	<ol style="list-style-type: none"> Converted to MaxLinear format. Updated Ordering Information and moved to end.

ECN 1513-06

Features

Receiver

- R³ Technology (Reconfigurable, Relayless, Redundancy)
- On chip clock and data recovery circuit for high input jitter tolerance
- Meets E3, DS3, and STS-1 jitter tolerance requirement
- Detects and clears LOS as per G.775
- Receiver monitor mode handles up to 20dB flat loss with 6dB cable attenuation
- On chip B3ZS and HDB3 encoder and decoder that can be either enabled or disabled
- On-chip clock synthesizer provides the appropriate rate clock from a single 12.288MHz clock
- Provides low jitter output clock

Transmitter

- R³ Technology (Reconfigurable, Relayless, Redundancy)
- Compliant with Bellcore GR-499, GR-253, and ANSI T1.102 Specifications for transmit pulse
- Tri-state transmit output capability for redundancy applications
- Each transmitter can be independently turned on or off
- Transmitters provide voltage output drive

Jitter Attenuator

- On chip advanced crystal-less jitter attenuator for each channel
- Jitter attenuator can be selected in receive, transmit path or disabled
- Meets ETSI TBR 24 jitter transfer requirements
- Compliant with jitter transfer template outlined in ITU G.751, G.752, G.755 and GR-499-CORE, 1995 standards
- 16 or 32 bits selectable FIFO size

Control and Diagnostics

- Parallel microprocessor interface for control and configuration

- Supports optional internal transmit driver monitoring
- Each channel supports analog, remote and digital loopbacks
- Single 3.3V \pm 5% power supply
- 5V-tolerant digital inputs
- Available in 420-pin TBGA thermally enhanced package
- - 40°C to 85°C industrial temperature range

Transmit Interface Characteristics

- Accepts either single-rail or dual-rail data from terminal equipment and generates a bipolar signal to the line
- Integrated pulse shaping circuit
- Built-in B3ZS and HDB3 encoder (which can be disabled)
- Accepts transmit clock with duty cycle of 30% - 70%
- Generates pulses that comply with the ITU-T G.703 pulse template for E3 applications
- Generates pulses that comply with the DSX-3 pulse template, as specified in Bellcore GR-499-CORE and ANSI T1.102_1993
- Generates pulses that comply with the STSX-1 pulse template, as specified in Bellcore GR-253-CORE
- Transmitter can be turned off in order to support redundancy designs

Receive Interface Characteristics

- Integrated adaptive receive equalization (optional) for optimal clock and data recovery
- Declares and clears the LOS defect per ITU-T G.775 requirements for E3 and DS3 applications
- Meets jitter tolerance requirements, as specified in ITU-T G.823_1993 for E3 Applications
- Meets jitter tolerance requirements, as specified in Bellcore GR-499-CORE for DS3 applications
- Declares Loss of Lock (LOL) alarm
- Built-in B3ZS / HDB3 decoder (which can be disabled)
- Recovered data can be muted while the LOS condition is declared
- Outputs either single-rail or dual-rail data to the terminal equipment

1.0 Pin Information

1.1 Pin Descriptions (by Function)

Table 1: System-Side Transmit Input and Transmit Control Pins

Pin #	Signal Name	Type	Description
P4	TxON	I	<p>Transmit On / Off Input</p> <p>Upon power up, the transmitters are powered on. Turning the transmitters on or off is selected through the microprocessor interface by programming the appropriate channel register if this pin is pulled "High". If the TxON pin is pulled "Low", all 12 transmitters are powered off.</p> <p>Note: TxON is ideal for redundancy applications. See the R³ Technology section of this datasheet for more details. Internally pulled "High".</p>
F22 AA22 H22 Y23 G26 AA25 G1 AA2 H5 Y4 F5 AA5	TxCLK0 TxCLK1 TxCLK2 TxCLK3 TxCLK4 TxCLK5 TxCLK6 TxCLK7 TxCLK8 TxCLK9 TxCLK10 TxCLK11	I	<p>Transmit Clock Input</p> <p>These input pins have three functions:</p> <ul style="list-style-type: none"> They function as the timing source for the transmit section of the corresponding channel within the XRT75R12. They are used by the transmit section of the LIU IC to sample the corresponding TxPOS_n and TxNEG_n input pins. They are used to clock the PRBS generator. <p>Note: The user is expected to supply a 44.736MHz ± 20ppm clock signal (for DS3 applications), 34.368MHz ± 20ppm clock signal (for E3 applications) or a 51.84MHz ± 4.6ppm clock signal (for STS-1, Stratum 3E, or better applications).</p>
E23 AB24 J22 AA23 G25 AA26 G2 AA1 J5 AA4 E4 AB3	TxPOS0 TxPOS1 TxPOS2 TxPOS3 TxPOS4 TxPOS5 TxPOS6 TxPOS7 TxPOS8 TxPOS9 TxPOS10 TxPOS11	I	<p>Transmit Positive Data Input</p> <p>The function of these digital input pins depends upon whether the corresponding channel has been configured to operate in the Single-Rail or Dual-Rail Mode.</p> <p>Single Rail Mode - Transmit Data Input</p> <p>Operating in the Single-Rail Mode, all transmit input data will be serially applied to this input pin. This signal will be latched into the transmit section circuitry on the active edge of the TxCLK_n signal.</p> <p>The transmit section of the LIU IC will then encode this data into either the B3ZS line code (for DS3 and STS-1 applications) or the HDB3 line code (for E3 applications).</p> <p>Dual Rail Mode - Transmit Positive Data Input</p> <p>In the Dual-Rail Mode, the user should apply a pulse to this input pin when a positive-polarity pulse is to be transmitted onto the line. This signal will be latched into the transmit section circuitry upon the active edge of the TxCLK_n signal.</p> <p>The transmit section of the LIU IC will NOT encode this data into either the B3ZS or HDB3 line codes. If the user configures the LIU IC to operate in the Dual-Rail Mode, B3ZS or HDB3 encoding must have already been done prior to this input.</p>

Table 1: (Continued) System-Side Transmit Input and Transmit Control Pins

Pin #	Signal Name	Type	Description
C25 AB25 H23 W23 H24 Y26 H3 Y1 H4 W4 C2 AB2	TxNEG0 TxNEG1 TxNEG2 TxNEG3 TxNEG4 TxNEG5 TxNEG6 TxNEG7 TxNEG8 TxNEG9 TxNEG10 TxNEG11	I	<p>Transmit Negative Data Input</p> <p>When a channel has been configured to operate in the Dual-Rail Mode, the user should apply a pulse to this input pin anytime the transmit section of the LIU IC to generate a negative-polarity pulse onto the line. This signal will be latched into the transmit section circuitry upon the active edge of the TxCLK_n signal.</p> <p>Note: In the Single-Rail Mode, this input pin has no function and should be tied to GND.</p>
B24 AE24 C20 AD20 C16 AD16 C11 AD11 C7 AD7 C3 AD3	TTip0 TTip1 TTip2 TTip3 TTip4 TTip5 TTip6 TTip7 TTip8 TTip9 TTip10 TTip11	O	<p>Transmit TTIP Output - Positive Polarity Signal</p> <p>These output pins, along with the corresponding TRING_n output pins, function as the transmit DS3, E3, or STS-1 line output signal drivers for a given channel of the XRT75R12.</p> <p>Connect this signal and the corresponding TRING_n output signal to a 1:1 transformer. Whenever the transmit section of the channel generates and transmits a positive-polarity pulse onto the line, this output pin will be pulsed to a higher voltage than its corresponding TRING_n output pins.</p> <p>Conversely, whenever the transmit section of the channel generates and transmit a negative-polarity pulse onto the line, this output pin will be pulsed to a lower voltage than its corresponding TRING_n output pin.</p> <p>Note: This output pin will be tri-stated whenever the TxON input pin or bit-field is set to "0".</p>

Table 2: System-Side Receive Output and Receive Control Pins

Pin #	Signal Name	Type	Description
D25 AD25 G23 AA24 J24 U24 J3 U3 G4 AA3 D2 AD2	RLOS0 RLOS1 RLOS2 RLOS3 RLOS4 RLOS5 RLOS6 RLOS7 RLOS8 RLOS9 RLOS10 RLOS11	O	<p>Receive Loss of Signal Output Indicator</p> <p>This output pin indicates a Loss of Signal (LOS) defect condition for the corresponding channel.</p> <p>"Low" - Indicates that the corresponding channel is NOT currently declaring the LOS defect condition.</p> <p>"High" - Indicates that the corresponding channel is currently declaring the LOS defect condition.</p>
G22 AB26 K22 U22 L24 W25 L3 W2 K5 U5 G5 AB1	RLOL0 RLOL1 RLOL2 RLOL3 RLOL4 RLOL5 RLOL6 RLOL7 RLOL8 RLOL9 RLOL10 RLOL11	O	<p>Receive Loss of Lock Output Indicator</p> <p>This output pin indicates a Loss of Lock (LOL) condition for the corresponding channel.</p> <p>"Low" - Indicates that the corresponding channel is NOT declaring the LOL condition.</p> <p>"High" - Indicates that the corresponding channel is currently declaring the LOL condition.</p> <p>Note: The receive section of a given channel will declare the LOL condition anytime the frequency of the Recovered Clock (RCLK) signal differs from that of the reference clock programmed for that channel by 0.5% or more.</p>
E25 AD26 G24 Y24 L22 T22 L5 T5 G3 Y3 E2 AD1	RxPOS0 RxPOS1 RxPOS2 RxPOS3 RxPOS4 RxPOS5 RxPOS6 RxPOS7 RxPOS8 RxPOS9 RxPOS10 RxPOS11	O	<p>Receive Positive Data Output</p> <p>The function of these output pins depends upon whether the channel has been configured to operate in the Single-Rail or Dual-Rail Mode.</p> <p>Dual-Rail Mode - Receive Positive Polarity Data Output</p> <p>If the channel has been configured to operate in the Dual-Rail Mode, then all positive-polarity data will be output via this pin. The negative-polarity data will be output via the corresponding RxNEG_n pin. In other words, the receive section of the corresponding channel will pulse this output pin "High" for one period of RCLK_n anytime it receives a positive-polarity pulse via the RTIP or RRING input pins.</p> <p>The data output via this pin is updated upon the active edge of the RxCLK_n output clock signal.</p> <p>Single-Rail Mode - Receive Data Output</p> <p>In the Single-Rail Mode, all receive (or recovered) data will be output via this pin. The data output via this pin is updated upon the active edge of the RxCLK_n output clock signal.</p>

Table 2: (Continued) System-Side Receive Output and Receive Control Pins

Pin #	Signal Name	Type	Description
F23 AC26 F24 U23 L23 T24 L4 T3 F3 U4 F4 AC1	RxNEG/LCV0 RxNEG/LCV1 RxNEG/LCV2 RxNEG/LCV3 RxNEG/LCV4 RxNEG/LCV5 RxNEG/LCV6 RxNEG/LCV7 RxNEG/LCV8 RxNEG/LCV9 RxNEG/LCV10 RxNEG/LCV11	O	<p>Receive Negative Data Output and Line Code Violation The function of these pins depends on whether the XRT75R12 is configured in Single Rail or Dual Rail Mode.</p> <p>Dual-Rail Mode - Receive Negative Polarity Data Output In the Dual-Rail Mode, all negative-polarity data will be output via this pin. The positive-polarity data will be output via the corresponding RxPOS_n output pin. In other words, the receive section of the corresponding channel will pulse this output pin "High" for one period of RxCLK_n anytime it receives a negative-polarity pulse via the RTIP or RRING input pins.</p> <p>The data output via this pin is updated upon the active edge of the RCLK_n output clock signal.</p> <p>Single-Rail Mode - Line Code Violation Indicator Output In the Single-Rail Mode, this output pin will function as the Line Code Violation indicator output.</p> <p>In this configuration, the receive section of the channel will pulse this output pin "High" for at least one RCLK period whenever it detects either an LCV (Line Code Violation) or an EXZ (Excessive Zero Event).</p> <p>The data that is output via this pin is updated upon the active edge of the RCLK_n output clock signal.</p>
E24 AC25 J23 V23 K24 T23 K3 T4 J4 V4 E3 AC2	RxCLK0 RxCLK1 RxCLK2 RxCLK3 RxCLK4 RxCLK5 RxCLK6 RxCLK7 RxCLK8 RxCLK9 RxCLK10 RxCLK11	O	<p>Receive Clock Output This output pin functions as the receive or recovered clock signal. All receive (or recovered) data will output via the RxPOS_n and RxNEG_n outputs upon the active edge of this clock signal.</p> <p>Additionally, if the device or channel has been configured to operate in the Single-Rail Mode, then the RNEG_n/LCV_n output pins will also be updated upon the active edge of this clock signal.</p>

Table 3: Receive Line Side Pins

Pin #	Signal Name	Type	Description
B22	RTip0	I	<p>Receive TIP Input</p> <p>These input pins, along with the corresponding RRing_n input pin, function as the receive DS3, E3, or STS-1 line input signal for a given channel of the XRT75R12.</p> <p>Connect this signal and the corresponding RRING_n input signal to a 1:1 transformer.</p> <p>Whenever the RTIP or RRING input pins are receiving a positive-polarity pulse within the incoming DS3, E3 or STS-1 line signal, this input pin will be pulsed to a higher voltage than its corresponding RRING_n input pin.</p> <p>Conversely, whenever the RTIP or RRING input pins are receiving a negative-polarity pulse within the incoming DS3, E3 or STS-1 line signal, this input pin will be pulsed to a lower voltage than its corresponding RRING_n input pin.</p>

Table 4: Clock Interface

Pin #	Signal Name	Type	Description
R5	SFM_EN	I	<p>Single Frequency Mode Enable This input pin is used to configure the XRT75R12 to operate in the SFM (Single Frequency Mode). When this feature is invoked, the SFM synthesizer will become active. By applying a 12.288MHz clock signal to the STS-1Clk /12M pin, the XRT75R12 will generate all of the appropriate clock signals (for example, 34.368MHz, 44.736MHz or 51.84MHz). The XRT75R12 internal circuitry will route each of these synthesized clock signals to the appropriate nodes of the corresponding channels in the XRT75R12. "Low" - Disables the Single Frequency Mode. In this setting, the user is required to supply to the E3CLK, DS3CLK or STS-1CLK input pins all of the relevant clock signals that are to be used within the chip. "High" - Enables the Single-Frequency Mode. Note: This input pin is internally pulled low.</p>
R1	E3Clk	I	<p>E3 Clock Input (34.368MHz ± 20ppm) If any one of the channels is configured in E3 mode, a reference clock of 34.368MHz ± 20ppm is applied to this input pin. If the LIU is used in E3 mode only, this pin must be connected to the DS3Clk input pin to have access to the internal microprocessor. Note: SFM mode negates the need for this clock.</p>
T1	DS3Clk	I	<p>DS3 Clock Input (44.736MHz ± 20ppm) If any one of the channels is configured in DS3 mode, a reference clock of 44.736MHz ± 20ppm is applied to this input pin. Note: SFM mode negates the need for this clock.</p>
U1	STS-1Clk / 12M	I	<p>STS-1 Clock Input (51.84MHz ± 20ppm) If any one of the channels is configured in STS-1 mode, a reference clock of 51.84MHz ± 20ppm is applied to this input pin. If the LIU is used in STS-1 mode only, this pin must be connected to the DS3Clk input pin to have access to the internal microprocessor. Single Frequency Mode Clock Input (12.288MHz ± 20ppm) In Single Frequency Mode, a reference clock of 12.288MHz ± 20ppm is connected to this pin and the internal clock synthesizer generates the appropriate clock frequencies based on the configuration of the rates (E3, DS3 or STS-1).</p>
C26 W22 K23 W24 J25 V25 J2 V2 K4 W3 C1 W5	CLKOUT0 CLKOUT1 CLKOUT2 CLKOUT3 CLKOUT4 CLKOUT5 CLKOUT6 CLKOUT7 CLKOUT8 CLKOUT9 CLKOUT10 CLKOUT11	O	<p>Reference Clock Out A reference clock pin is provided for each channel that will supply a precise data rate frequency derived from either the clock input pin (E3Clk, DS3Clk, or STS-1Clk) or the 12.288MHz input in SFM mode. This frequency will be as stable as the original source. It is designed to provide the attached framer with its appropriate reference clock.</p>

Table 5: General Control Pins

Pin #	Signal Name	Type	Description
P3	TEST	****	Factory Test Mode Input Pin This pin must be connected to GND for normal operation. Note: This input pin is internally pulled "Low".
AE25	TRST	I	Test Reset Test boundary scan.
AB23	TMS	I	Test Mode Select Test boundary scan.
AB5	TCK	I	Test Clock Test boundary scan.
AB4	TDI	I	Test Data Input Test boundary scan.
AE2	TDO	O	Test Data Output Test boundary scan.

Table 6: Microprocessor Parallel Interface

Pin #	Signal Name	Type	Description
J26	Pmode	I	Microprocessor Parallel Interface Mode "High" sets a synchronous clocked interface mode with a clock from the host. "Low" sets an asynchronous mode where a clock internal to the XRT75R12 will time the operations.
P24	PCLK	I	High speed clock supplied by the host to provide timing in the Synchronous Interface Mode. This signal must be a square-wave.
N24	\overline{CS}	I	Chip Select Input (active low) Initiates a read or write operation. When "High", no parallel communication is active between the LIU and the host.
N22	\overline{WR}	I	Write Input (active low) Enables the host to write data D[7:0] into the LIU register space at address Addr[7:0].
N23	\overline{RD}	I	Read Input (active low) Commands the LIU to transfer the contents of a register specified by Addr[7:0] to the host.
N25	\overline{RDY}	O	Ready Line Output (active low) Provides a handshake between the LIU and the host that communicates when an operation has been completed. Note: This pin must be pulled "High" with a 3k Ω \pm 1% resistor.
K25 M22 M23 M24 K26 L26 M26 N26	Addr0 Addr1 Addr2 Addr3 Addr4 Addr5 Addr6 Addr7	I	An eight bit direct address bus that specifies the source or destination register for a read or write operation.

Table 6: Microprocessor Parallel Interface (Continued)

Pin #	Signal Name	Type	Description
P22 R26 T26 U26 R25 R24 R23 R22	D0 D1 D2 D3 D4 D5 D6 D7	I/O	An eight bit bi-directional data bus that provides the data into the LIU for a write operation or the data out to the host for a read operation.
P26	$\overline{\text{INT}}$	O	<p>Interrupt Active Output (active low) Normally, this output pin will be pulled "High". However, if the user enables interrupts within the LIU, and if those conditions occur, the XRT75R12 will signal an interrupt from the microprocessor by pulling this output pin "Low". The host microprocessor must ascertain the source of the interrupt and service it. Reading the source of the interrupt will clear the flag and the INT pin will go back high unless another interrupt has gone active.</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. This pin will remain "Low" until the interrupt has been serviced. 2. This pin must be pulled "High" with a $3\text{k}\Omega \pm 1\%$ resistor.
N2	$\overline{\text{RESET}}$	I	<p>Reset Input Pulsing this input "Low" causes the XRT75R12 to reset the contents of the on-chip command registers to their default values. As a consequence, the XRT75R12 will then also be operating in its default condition. For normal operation, this input pin should be at a logic "High".</p> <p>Note: This input pin is internally pulled high.</p>

Table 7: Power Supply Pins

Pin Name	Pin Numbers	Description
RVDD0	D22	Receive Analog Power Supply (3.3V ±5%) RVDD should not be shared with other power supplies. It is recommended that RVDD be isolated from the digital power supply DVDD and the analog power supply TVDD. For best results, use an internal power plane for isolation. If an internal power plane is not available, a ferrite bead can be used. Each power supply pin should be bypassed to ground through an external 0.1µF capacitor.
RVDD1	AC22	
RVDD2	D18	
RVDD3	AC18	
RVDD4	E15	
RVDD5	AB15	
RVDD6	E12	
RVDD7	AB12	
RVDD8	A9	
RVDD9	AF9	
RVDD10	D5	
RVDD11	AC5	
TVDD0	B23	Transmit Analog Power Supply (3.3V ±5%) TVDD can be shared with DVDD. However, it is recommended that TVDD be isolated from the analog power supply RVDD. For best results, use an internal power plane for isolation. If an internal power plane is not available, a ferrite bead can be used. Each power supply pin should be bypassed to ground through an external 0.1µF capacitor.
TVDD1	AE23	
TVDD2	B19

2.0 Functional Description

The XRT75R12 is a twelve channel fully integrated Line Interface Unit featuring MaxLinear's R³ Technology (Reconfigurable, Relayless Redundancy) for E3, DS3, and STS-1 applications. The LIU incorporates 12 independent receivers, transmitters and jitter attenuators in a single 420-lead TBGA package. Each channel can be independently programmed to support E3, DS-3 or STS-1 line rates using one input clock reference of 12.288MHz in Single Frequency Mode (SFM). The LIU is responsible for providing the physical connection between a line interface and an aggregate mapper or framing device. Along with the analog-to-digital processing, the LIU offers monitoring and diagnostic features to help optimize network design implementation. A key characteristic within the network topology is Automatic Protection Switching (APS). MaxLinear's proven expertise in providing redundancy solutions has paved the way for R³ Technology.

3.0 R³ Technology (Reconfigurable, Relayless, Redundancy)

Redundancy is used to introduce reliability and protection into network card design. The redundant card in many cases is an exact replicate of the primary card, such that when a failure occurs the network processor can automatically switch to the backup card. MaxLinear's R³ technology has re-defined E3, DS-3, and STS-1 LIU design for 1:1 and 1+1 redundancy applications. Without relays and with one bill of materials, MaxLinear offers multi-port, integrated LIU solutions to assist in high density aggregate applications and framing requirements with reliability. The following section can be used as a reference for implementing R³ Technology with MaxLinear's world leading line interface units.

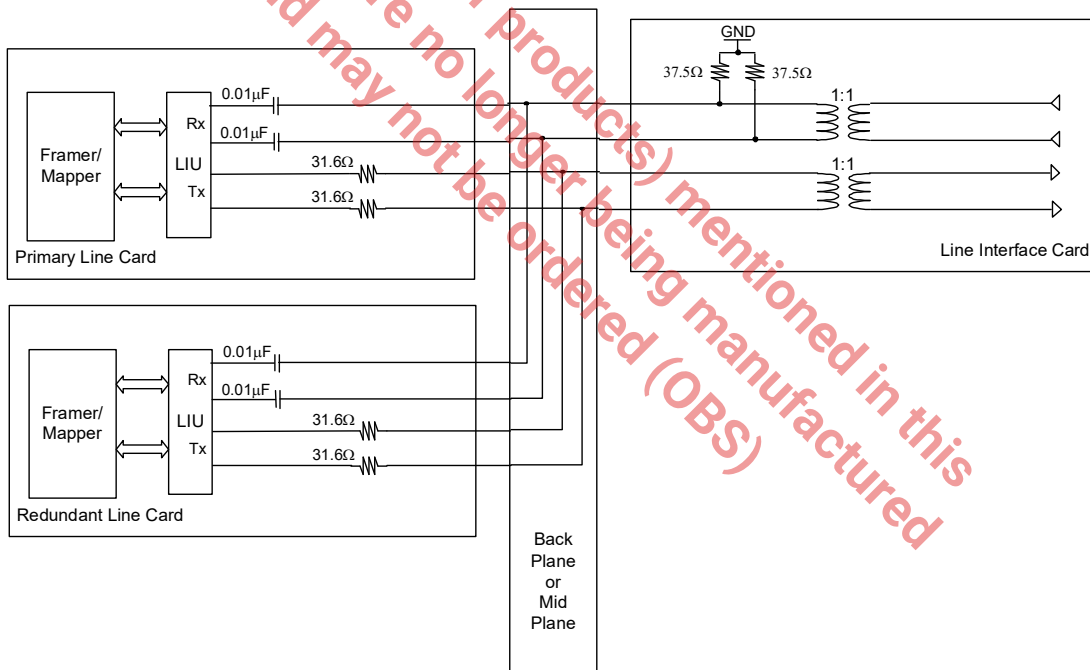

Figure 2: Network Redundancy Architecture

3.1 Network Architecture

A common network design that supports 1:1 or 1+1 redundancy consists of N primary cards along with N backup cards that connect into a mid-plane or back-plane architecture without transformers installed on the network cards. In addition to the network cards, the design has a line interface card with one source of transformers, connectors, and protection components that are common to both network cards. With this design, the bill of materials is reduced to the fewest amount of components. See [Figure 2](#). for a simplified block diagram of a typical redundancy design.

4.0 Clock Synthesizer

The LIU uses a flexible user interface for accepting clock references to generate the internal master clocks used to drive the LIU. The reference clock used to supply the microprocessor timing is generated from the DS3 or SFM clock input. Therefore, if the chip is configured for STS-1 only or E3 only, then the DS3 input pin must be connected to the STS-1 pin or E3 pin respectively. In DS3 mode or when SFM is used, the STS-1 and E3 input pins can be left unconnected. If SFM is enabled by pulling the SFM_EN pin "High", 12.288MHz is the only clock reference necessary to generate DS3, E3, or STS-1 line rates and the microprocessor timing. A simplified block diagram of the clock synthesizer is shown in [Figure 3](#). Reference clock performance specifications can be found on [Table 10](#) below.

Figure 3: Simplified Block Diagram of the Input Clock Circuitry Driving the Microprocessor

Table 10: Reference Clock Performance Specifications

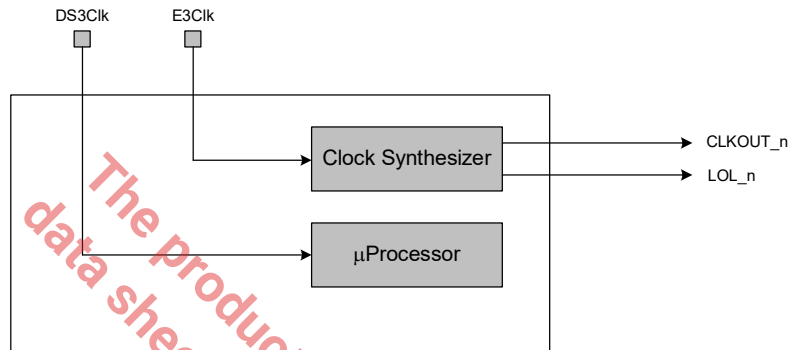

Symbol	Parameter	Min	Typ	Max	Units
REF_DUTY	Reference clock duty cycle	40		60	%
REF_E3	E3 reference clock frequency tolerance ⁽¹⁾	-20		+20	ppm
REF_DS3	DS3 reference clock frequency tolerance ⁽¹⁾	-20		+20	ppm
REF_STS1	STS-1 reference clock frequency tolerance ⁽¹⁾	-20		+20	ppm
REF_SFM	SFM reference clock frequency tolerance ⁽¹⁾	-20		+20	ppm
t _{RISE_REFCLK}	Reference clock rise time (10% to 90%)			5	ns
t _{FALL_REFCLK}	Reference clock fall time (90% to 10%)			5	ns
CLK_JIT	Reference clock jitter stability ⁽²⁾			0.005	UI _{P2P}

1. Required to meet Bellcore GR-499 specification on frequency stability requirements. However, the LIU can functionally operate with ±100 ppm without meeting the required specifications.

2. Reference clock jitter limits are required for the transmit output to meet ITU-T and Bellcore system level jitter requirements.

4.1 Clock Distribution

Network cards that are designed to support multiple line rates which are not configured for Single Frequency Mode should ensure that a clock is applied to the DS3Clk input pin. For example: If the network card being supplied to an ISP requires E3 only, the DS3 input clock reference is still necessary to provide read and write access to the internal microprocessor. Therefore, the E3 mode requires two input clock references. However if multiple line rates will not be supported, for example E3 only, then the DS3Clk input pin may be hard wire connected to the E3Clk input pin.

1. For one input clock reference, the single frequency mode should be used.

Figure 4: Clock Distribution Configured in E3 Mode without Using SFM

5.0 Receiver

The receiver is designed so that the LIU can recover clock and data from an attenuated line signal caused by cable loss or flat loss according to industry specifications. Once data is recovered, it is processed and presented at the receiver outputs according to the format chosen to interface with a Framer and Mapper or ASIC. This section describes the detailed operation of various blocks within the receive path. A simplified block diagram of the receive path is shown in Figure 5.

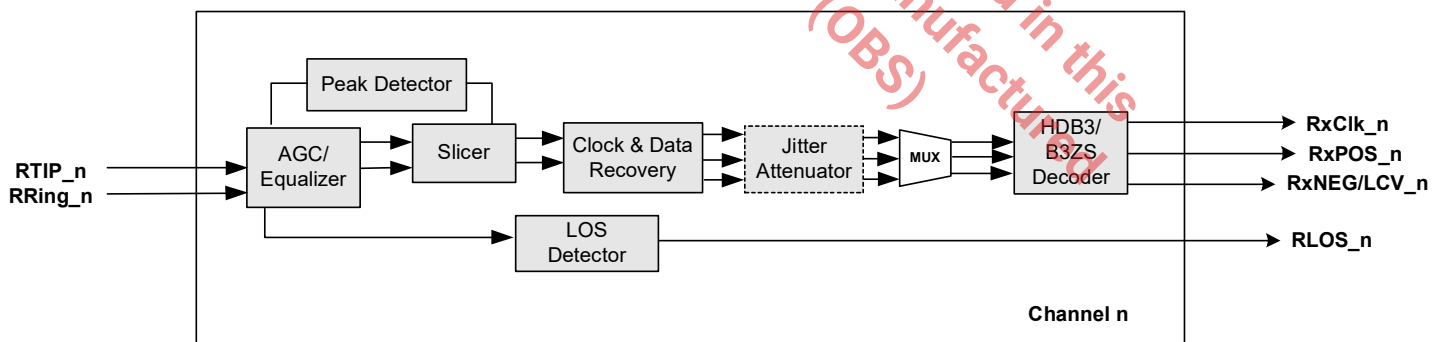

Figure 5: Receive Path Block Diagram

5.1 Receive Line Interface

Physical Layer devices are AC coupled to a line interface through a 1:1 transformer. The transformer provides isolation and a level shift by blocking the DC offset of the incoming data stream. The typical medium for the line interface is a 75Ω coaxial cable. Whether using E3, DS3 or STS-1, the LIU requires the same bill of materials, see [Figure 6](#).

Figure 6: Receive Line Interface Connection

5.2 Adaptive Gain Control (AGC)

The Adaptive Gain Control circuit amplifies the incoming analog signal and compensates for the various flat losses and also for the loss at one-half symbol rate. The AGC has a dynamic range of 30dB. The peak detector provides feedback to the equalizer before slicing occurs.

5.3 Receive Equalizer

The equalizer restores the integrity of the signal and compensates for the frequency dependent attenuation of up to 900 feet of coaxial cable (1300 feet for E3). The equalizer also boosts the high frequency content of the signal to reduce Inter-Symbol Interference (ISI) so that the slicer slices the signal at 50% of peak voltage to generate positive and negative data. The equalizer can be disabled by programming the appropriate register.

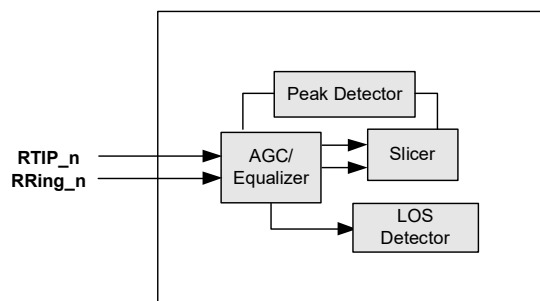

Figure 7: AGC and Equalizer Block Diagram

5.3.1 Recommendations for Equalizer Settings

The equalizer has two gain settings to provide optimum equalization. In the case of normally shaped DS3 and STS-1 pulses (pulses that meet the template requirements) that have been driven through 0 to 900 feet of cable, the equalizer can be enabled. However, for square-shaped pulses such as E3 or for DS3 and STS-1 high pulses (that do not meet the pulse template requirements), it is recommended that the equalizer be disabled for cable length less than 300 feet. This would help to prevent over-equalization of the signal and thus optimize the performance in terms of better jitter transfer characteristics. The equalizer also contains an additional 20dB gain stage to provide the line monitoring capability (Receive Monitor Mode) of the resistively attenuated signals which may have 20dB of flat loss. The equalizer and the equalizer gain mode can be enabled by programming the appropriate register. However, enabling the Equalizer Gain Mode (Receive Monitor Mode) suppresses the internal LOS circuitry and LOS will never assert nor LOS be declared when operating with Receive Monitor Mode enabled.

Note: The results of extensive testing indicate that even when the Equalizer was enabled, regardless of the cable length, the integrity of the E3 signal was restored properly over 0 to 12dB cable loss at industrial temperature.

5.4 Clock and Data Recovery

The Clock and Data Recovery Circuit extracts the embedded clock, RxClk_n from the sliced digital data stream, and provides the retimed data to the B3ZS (HDB3) decoder. The Clock Recovery PLL can be in one of the following two modes:

5.4.1 Data and Clock Recovery Mode

In the presence of input line signals on the RTIP_n and RRing_n input pins and when the frequency difference between the recovered clock signal and the reference clock signal is less than 0.5%, the clock that is output on the RxClk_n out pins is the recovered clock signal.

5.4.2 Training Mode

In the absence of input signals at RTIP_n and RRing_n pins, or when the frequency difference between the recovered line clock signal and the reference clock applied on the ExClk_n input pins exceed 0.5%, a Loss of Lock condition is declared by toggling RLOL_n output pin “High” or setting the RLOL_n bit to “1” in the control register. Also, the clock output on the RxClk_n pins are the same as the reference channel clock.

5.5 LOS (Loss of Signal) Detector

5.5.1 DS3 and STS-1 LOS Condition

A Digital Loss of Signal (DLOS) condition occurs when a string of 175 ± 75 consecutive zeros occur on the line. When the DLOS condition occurs, the DLOS_n bit is set to “1” in the Status Control Register. DLOS condition is cleared when the detected average pulse density is greater than 33% for 175 ± 75 pulses. An Analog Loss of Signal (ALOS) condition occurs when the amplitude of the incoming line signal is below the threshold as shown in the [Table 11](#). The status of the ALOS condition is reflected in the ALOS_n Status Control Register. RLOS is the logical OR of the DLOS and ALOS states. When the RLOS condition occurs, the RLOS_n output pin is toggled “High” and the RLOS_n bit is set to “1” in the Status Control Register.

5.5.2 Disabling ALOS and DLOS Detection

For debugging purposes it is useful to disable the ALOS and / or DLOS detection. Writing a “1” to both ALOSDIS_n and DLOSDIS_n bits disables the LOS detection on a per channel basis.

5.5.3 E3 LOS Condition

If the level of incoming line signal drops below the threshold as described in the ITU-T G.775 standard, the LOS condition is detected. Loss of signal is defined as no transitions for 10 to 255 consecutive zeros. No transitions is defined as a signal level between 15 and 35dB below the normal. This is illustrated in [Figure 8](#). The LOS condition is cleared within 10 to 255 UI after restoration of the incoming line signal. [Figure 8](#) also shows the LOS declaration and clearance conditions.

Table 11: ALOS Declaration and Clearance Thresholds for Given REQEN Settings (DS3 and STS-1 Applications)

Application	REQEN Setting	Signal Level to Declare ALOS Defect	Signal Level to Clear ALOS Defect
DS3	0	< 41mVpk	> 102mVpk
	1	< 52mVpk	> 117mVpk
STS-1	0	< 51mVpk	> 114mVpk
	1	< 58mVpk	> 133mVpk

Figure 8: Loss of Signal Definition for E3 as per ITU-T G.775

5.5.4 Interference Tolerance

For E3 mode, ITU-T G.703 Recommendation specifies that the receiver be able to recover error free clock and data in the presence of a sinusoidal interfering tone signal. For DS3 and STS-1 modes, the same recommendation is being used.

Figure 9 shows the configuration to test the interference margin for DS3 and STS1. Figure 10 shows the set up for E3.

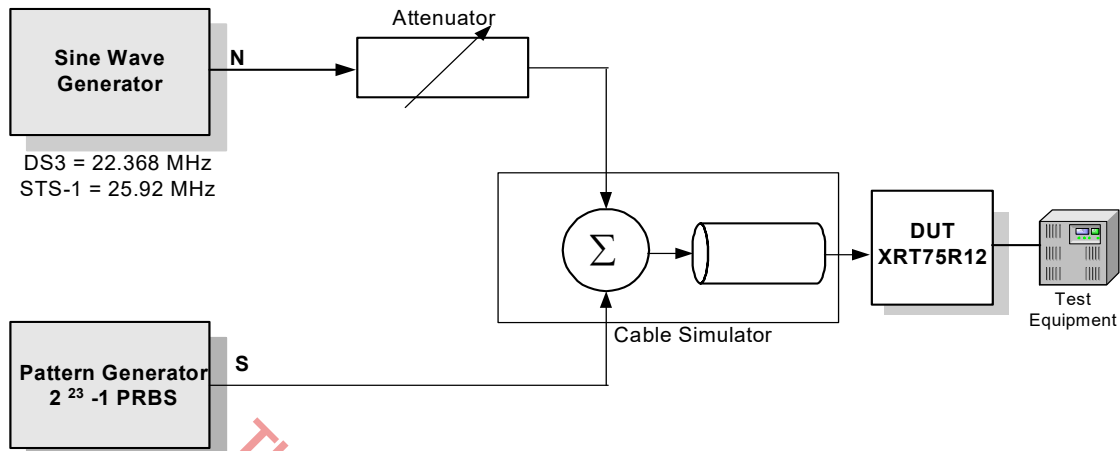

Figure 9: Interference Margin Test Set Up for DS3 and STS-1

Figure 10: Interference Margin Test Set Up for E3

Table 12: Interference Margin Test Results

Mode	Cable Length (Attenuation)	Interference Tolerance
E3	0dB	Equalizer "IN"
	12dB	-17dB
DS3	0ft	-15dB
	225ft	-15dB
	450ft	-14dB
STS-1	0ft	-15dB
	225ft	-14dB
	450ft	-14dB

5.5.5 Muting the Recovered Data with LOS Condition

When the LOS condition is declared, the Clock Recovery circuit locks into the reference clock applied to the internal master clock outputs this clock onto the RxClk_n output pin. The data on the RxPOS_n and RxNEG_n pins can be forced to zero by setting the LOSMUT_n bits in the individual channel control register to “1”.

Note: When the LOS condition is cleared, the recovered data is output on RxPOS_n and RxNEG_n pins.

Figure 11: Receiver Data Output and Code Violation Timing

Table 13: Receiver Data Output and Code Violation Timing

Symbol	Parameter	Min	Typ	Max	Units
RxCIk	Duty Cycle	45	50	55	%
	RxCIk Frequency				
	E3		34.368		MHz
	DS3		44.736		MHz
	STS-1		51.84		MHz
t_{RRX}	RxCIk rise time (10% to 90%)		2	4	ns
t_{FRX}	RxCIk fall time (10% to 90%)		2	4	ns
t_{CO}	RxCIk to RPOS or RNEG delay time			4	ns
t_{LCVO}	RxCIk to rising edge of LCV output delay		2.5		ns

5.6 B3ZS and HDB3 Decoder

The decoder block takes the output from the clock and data recovery block and decodes the B3ZS (for DS3 or STS-1) or HDB3 (for E3) encoded line signal and detects any coding errors or excessive zeros in the data stream. Whenever the input signal violates the B3ZS or HDB3 coding sequence for bipolar violation or contains three (for B3ZS) or four (for HDB3) or more consecutive zeros, an active “High” pulse is generated on the RLCV_n output pins to indicate line code violation.

6.0 Transmitter

The transmitter is designed so that the LIU can accept serial data from a local device, encode the data properly, and then output an analog pulse according to the pulse shape chosen in the appropriate registers. This section describes the detailed operation of various blocks within the transmit path. A simplified block diagram of the transmit path is shown in Figure 12.

Figure 12: Transmit Path Block Diagram

6.1 Transmit Digital Input Interface

The method for applying data to the transmit inputs of the LIU is a serial interface consisting of TxClk, TxPOS, and TxNEG. For single rail mode, only TxClk and TxPOS are necessary for providing the local data from a framer device or ASIC. Data can be sampled on either edge of the input clock signal by programming the appropriate register. A typical interface is shown in Figure 13.

Figure 13: Typical Interface Between Terminal Equipment and the XRT75R12 (Dual-Rail Data)

Figure 14: Transmitter Terminal Input Timing

Table 14: Transmitter Terminal Input Timing

Symbol	Parameter	Min	Typ	Max	Units
TxCk	Duty Cycle	30	50	70	%
	TxCk Frequency				
	E3		34.368		MHz
	DS3		44.736		MHz
	STS-1		51.84		MHz
t_{RTX}	TxCk rise time (10% to 90%)			4	ns
t_{FTX}	TxCk fall time (10% to 90%)			4	ns
t_{TSU}	TPData or TNData to TxCk falling set up time	3			ns
t_{THO}	TPData or TNData to TxCk falling hold time	3			ns

Figure 15: Single-Rail or NRZ Data Format (Encoder and Decoder are Enabled)

Figure 16: Dual-Rail Data Format (Encoder and Decoder are Disabled)

6.2 Transmit Clock

The transmit clock applied via TxClk_n pins, for the selected data rate (E3 = 34.368MHz, DS3 = 44.736MHz, or STS-1 = 51.84MHz), is duty cycle corrected by the internal PLL circuit to provide a 50% duty cycle clock to the pulse shaping circuit. This allows a 30% to 70% duty cycle transmit clock to be supplied.

6.3 B3ZS and HDB3 Encoder

When the Single-Rail (NRZ) data format is selected, the encoder block encodes the data into either B3ZS format (for either DS3 or STS-1) or HDB3 format (for E3).

6.3.1 B3ZS Encoding

An example of B3ZS encoding is shown in Figure 17. If the encoder detects an occurrence of three consecutive zeros in the data stream, it is replaced with either B0V or 00V, where 'B' refers to Bipolar pulse that is compliant with the alternating polarity requirement of the AMI (Alternate Mark Inversion) line code and 'V' refers to a Bipolar Violation (for example, a bipolar pulse that violates the AMI line code). The substitution of B0V or 00V is made so that an odd number of bipolar pulses exist between any two consecutive violation (V) pulses. This avoids the introduction of a DC component into the line signal.

Figure 17: B3ZS Encoding Format

6.3.2 HDB3 Encoding

An example of the HDB3 encoding is shown in Figure 18. If the HDB3 encoder detects an occurrence of four consecutive zeros in the data stream, then the four zeros are substituted with either a 000V or B00V pattern. The substitution code is made in such a way that an odd number of pulses exist between any consecutive V pulses. This avoids the introduction of DC component into the analog signal.

Figure 18: HDB3 Encoding Format

6.4 Transmit Pulse Shaper

The transmit pulse shaper converts the B3ZS encoded digital pulses into a single analog Alternate Mark Inversion (AMI) pulse that meets the industry standard mask template requirements for STS-1 and DS3. For E3 mode, the pulse shaper converts the HDB3 encoded pulses into a single full amplitude square shaped pulse with very little slope. The pulse shaper block also includes a transmit build out circuit, which can either be disabled or enabled by setting the TxLEV_n bit to "1" or "0" in the control register. For DS3 or STS-1 rates, the transmit build out circuit is used to shape the transmit waveform that ensures that

transmit pulse template requirements are met at the Cross-Connect system. The distance between the transmitter output and the Cross-Connect system can be between 0 to 450 feet. For E3 rate, since the output pulse template is measured at the secondary of the transformer and since there is no Cross-Connect system pulse template requirements, the transmit build out circuit is always disabled. The differential line driver increases the transmit waveform to appropriate level and drives into the 75Ω load as shown in Figure 19.

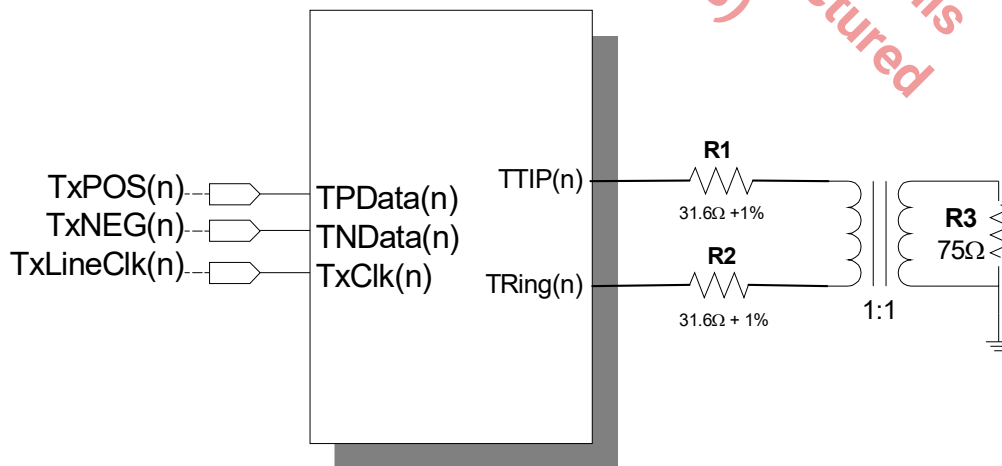

Figure 19: Transmit Pulse Shape Test Circuit

6.4.1 Guidelines for Using Transmit Build Out Circuit

If the distance between the transmitter and the DSX3 or STSX-1, Cross-Connect system is less than 225 feet, enable the transmit build out circuit by setting the TxLEV_n control bit to "0". If the distance between the transmitter and the DSX3 or STSX-1 is greater than 225 feet, disable the transmit build out circuit.

6.5 E3 Line Side Parameters

The XRT75R12 line output at the transformer output meets the pulse shape specified in ITU-T G.703 for 34.368Mbps operation. The pulse mask as specified in ITU-T G.703 for 34.368Mbps is shown in Figure 20.

Figure 20: Pulse Mask for E3 (34.368Mbps) Interface per ITU-T G.703

Table 15: E3 Transmitter Line Side Output and Receiver Line Side Input Specifications

Parameter	Min	Typ	Max	Units
Transmitter Line Side Output Characteristics				
Transmit output pulse amplitude (Measured at secondary of the transformer)	0.90	1.00	1.10	V _{pk}
Transmit output pulse amplitude ratio	0.95	1.00	1.05	
Transmit output pulse width	12.5	14.55	16.5	ns

6.6 Transmit Drive Monitor

This feature is used for monitoring the transmit line for occurrence of fault conditions such as a short circuit on the line or a defective line driver. To activate this function, connect MTIP_n pins to the TTIP_n lines via a 270Ω resistor and MRing_n pins to TRing_n lines via 270Ω resistor as shown in Figure 23.

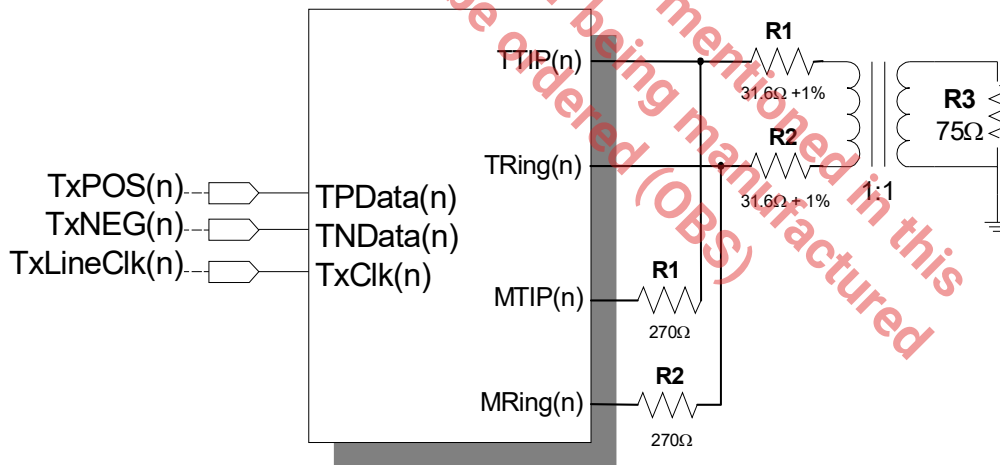

Figure 23: Transmit Driver Monitor Set Up

When the MTIP_n and MRing_n are connected to the TTIP_n and TRing_n lines, the Drive Monitor circuit monitors the line for transitions. The DMO_n (Drive Monitor Output) will be asserted “Low” as long as the transitions on the line are detected via MTIP_n and MRing_n. If no transitions on the line are detected for 128 ±32 TxClk_n

periods, the DMO_n output toggles “High” and when the transitions are detected again, DMO_n toggles “Low”.

Note: The Drive Monitor circuit is only for diagnostic purpose and does not have to be used to operate the transmitter.

6.7 Transmitter Section On or Off

The transmitter section of each channel can either be turned on or off. To turn on the transmitter, set the input pin TxON to “High” and write a “1” to the TxON_n control bit. When the transmitter is turned off, TTIP_n and TRing_n are tri-stated.

Notes:

1. This feature provides support for redundancy.
2. If the XRT75R12 is configured in Host Mode, to permit a system designed for redundancy to quickly shut off the defective line card and turn on the back-up line card, writing a “1” to the TxON_n control bits transfers the control to the TxON pin.

7.0 Jitter

There are three fundamental parameters that describe circuit performance relative to jitter:

- Jitter Tolerance
- Jitter Transfer
- Jitter Generation

7.1 Jitter Tolerance

Jitter tolerance is a measure of how well a clock and data recovery unit can successfully recover data in the presence of various forms of jitter. It is characterized by the amount of jitter required to produce a specified bit error rate. The tolerance depends on the frequency content of the jitter. Jitter tolerance is measured as the jitter amplitude over a jitter spectrum for which the clock and data recovery unit achieves a specified bit error rate (BER). To measure the jitter tolerance as shown in Figure 24, jitter is introduced by the sinusoidal modulation of the serial data bit sequence. Input jitter tolerance requirements are specified in terms of compliance with jitter mask which is represented as a combination of points. Each point corresponds to a minimum amplitude of sinusoidal jitter at a given jitter frequency.

Figure 24: Jitter Tolerance Measurements

7.1.1 DS3 and STS-1 Jitter Tolerance Requirements

Bellcore GR-499 CORE specifies the minimum requirement of jitter tolerance for Category I and Category II. The jitter tolerance requirement for Category II is the most stringent. Figure 25 shows the jitter tolerance curve as per GR-499 specification.

Figure 25: Input Jitter Tolerance for DS3 and STS-1

7.1.2 E3 Jitter Tolerance Requirements

ITU-T G.823 standard specifies that the clock and data recovery unit must be able to tolerate jitter up to certain specified limits. Figure 26 shows the tolerance curve.

Figure 26: Input Jitter Tolerance for E3

As shown in the jitter tolerance measurement, of the figures above, the dark line indicates the minimum level of jitter that the E3, DS3 and STS-1 compliant component must tolerate. Table 20 below shows the jitter amplitude versus the modulation frequency for various standards.

Table 20: Jitter Amplitude versus Modulation Frequency (Jitter Tolerance)

Bit Rate (kbps)	Standard	Input Jitter Amplitude (UI _{p-p})			Modulation Frequency				
		A1	A2	A3	f1 (Hz)	f2 (Hz)	f3 (Hz)	f4 (Hz)	f5 (Hz)
34368	ITU-T G.823	1.5	0.15	-	100	1000	10	800	-
44736	GR-499 CORE Cat I	5	0.1	-	10	2.3k	60	300	-
44736	GR-499 CORE Cat II	10	0.3	-	10	669	22.3	300	-
51840	GR-253 CORE Cat II	15	1.5	0.15	10	30	300	2	20

7.2 Jitter Transfer

Jitter Transfer Function is defined as the ratio of jitter on the output relative to the jitter applied on the input versus frequency. There are two distinct characteristics in jitter transfer: jitter gain (jitter peaking), defined as the highest ratio above 0dB and jitter transfer bandwidth. The overall jitter transfer bandwidth is controlled by a low bandwidth loop, typically using a voltage-controlled crystal oscillator (VCXO).

The Jitter Transfer Function is a ratio between the jitter output and jitter input for a component or system, often expressed in dB. A negative dB jitter transfer indicates the element removed jitter. A positive dB jitter transfer indicates the element added jitter. A zero dB jitter transfer indicates the element had no effect on jitter. Table 21 shows the jitter transfer characteristics and jitter attenuation specifications for various data rates:

Table 21: Jitter Transfer Specification and Reference

E3	DS3	STS-1
ETSI TBR-24	GR-499 CORE section 7.3.2 Category I and Category II	GR-253 CORE section 5.6.2.1

1. The above specifications can be met only with a jitter attenuator that supports E3, DS3, and STS-1 rates.

7.3 Jitter Attenuator

An advanced crystal-less jitter attenuator per channel is included in the XRT75R12. The jitter attenuator requires no external crystal nor high-frequency reference clock. Clearing or setting the JATx_n or JARx_n bits in the channel control registers selects the jitter attenuator either in the receive or transmit path on a per channel basis. The FIFO size can be either 16-bit or 32-bit. The bits JA0_n and JA1_n can be set to an appropriate combination to select the different FIFO sizes or to disable the jitter attenuator on a per channel basis. Data is clocked into the FIFO with the associated clock signal (TxClk or RxClk) and clocked out of the FIFO with the de-jittered clock. When the FIFO is within two bits of overflowing or underflowing, the FIFO limit status bit FL_n is set to "1" in the Alarm Status Register. Reading this bit clears the FIFO and resets the bit into a default state.

Note: It is recommended to select the 16-bit FIFO for delay sensitive applications as well as for removing smaller amounts of jitter. Table 22 specifies the jitter transfer mask requirements for various data rates:

Table 22: Jitter Transfer Pass Masks

Rate (kbps)	Mask	f1 (Hz)	f2 (Hz)	f3 (Hz)	f4 (Hz)	A1 (dB)	A2 (dB)
34368	G.823 ETSI-TBR-24	100	300	3k	800k	0.5	-19.5
44736	GR-499, Cat I	10	10k	-	15k	0.1	-
	GR-499, Cat II	10	56.6k	-	300k	0.1	-
	GR-253 CORE	10	40	-	15k	0.1	-
51840	GR-253 CORE	10	40k	-	400k	0.1	-

The jitter attenuator within the XRT75R12 meets the latest jitter attenuation specifications and jitter transfer characteristics as shown in the [Figure 27](#).

**Figure 27: Jitter Transfer Requirements and Jitter Attenuator Performance**

7.3.1 Jitter Generation

Jitter Generation is defined as the process whereby jitter appears at the output port of the digital equipment in the absence of applied input jitter. Jitter Generation is measured by sending jitter free data to the clock and data recovery circuit and measuring the amount of jitter on the output clock or the re-timed data. Since this is essentially a noise measurement, it requires a definition of bandwidth to be meaningful. The bandwidth is set according to the data rate. In general, the jitter is measured over a band of frequencies.

8.0 Diagnostic Features

8.1 PRBS Generator and Detector

The XRT75R12 contains an on-chip Pseudo Random Binary Sequence (PRBS) generator and detector for diagnostic purposes. With the PRBSEN_n bit = “1”, the transmitter will send out a PRBS of $2^{23} - 1$ in E3 rate or $2^{15} - 1$ in STS-1 or DS3 rate. At the same time, the receiver PRBS detector is also enabled. When the correct PRBS pattern is detected by the receiver, the RNEG/LCV pin will go “Low” to indicate PRBS synchronization has been achieved. When the PRBS detector is not in sync, the PRBSLS bit will be set to “1” and the RNEG/LCV pin will go “High”.

With the PRBS mode enabled, the user can also insert a single bit error by toggling the “INSPRBS” bit. This is done by writing a “1” to INSPRBS bit. The receiver at the RNEG/LCV pin will pulse “High” for one RxClk cycle for every bit error detected. Any subsequent single bit error insertion must be done by first writing a “0” to the INSPRBS bit, and followed by a “1”.

Figure 28 shows the status of the RNEG/LCV pin when the XRT75R12 is configured in PRBS mode.

Note: In PRBS mode, the device is forced to operate in Single-Rail Mode.

Figure 28: PRBS Mode

8.2 Loopbacks

The XRT75R12 offers three loopback modes for diagnostic purposes. The loopback modes are selected via the RLB_n and LLB_n bits and the channel control registers select the loopback modes.

8.2.1 Analog Loopback

In this mode, the transmitter outputs TTIP_n and TRing_n are internally connected to the receiver inputs RTIP_n and RRing_n as shown in Figure 29. Data and clock are output at the RxClk_n, RxPOS_n and RxNEG_n pins for the corresponding transceiver. Analog loopback exercises most of the functional blocks of the device, including the jitter attenuator which can be selected in either the transmit or receive path.

Notes:

1. In the Analog Loopback Mode, data is also output via TTIP_n and TRing_n pins.
2. Signals on the RTIP_n and RRing_n pins are ignored during analog loopback.

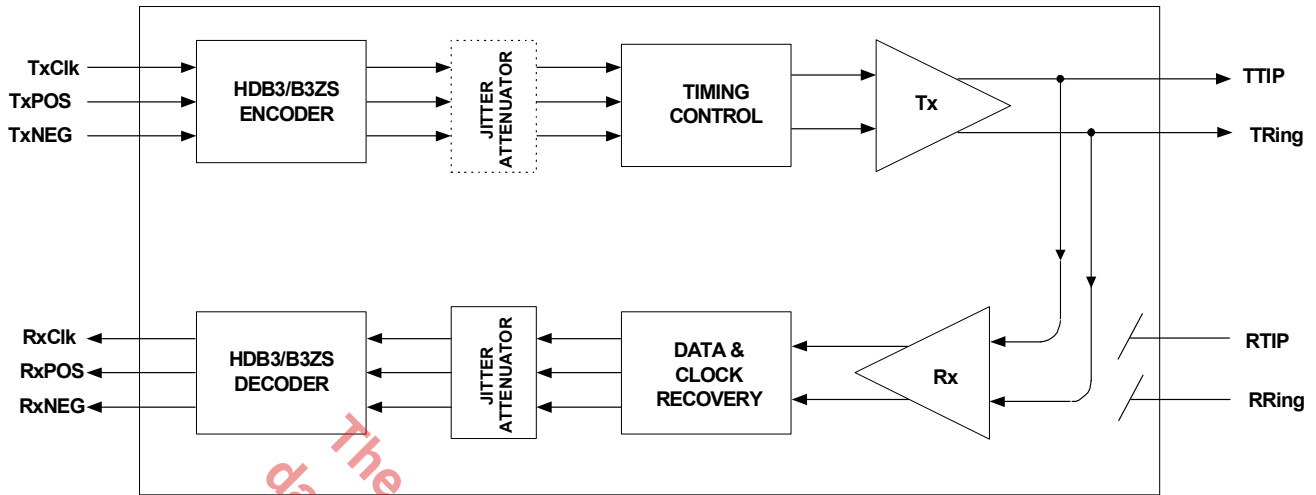

Figure 29: Analog Loopback

8.2.2 Digital Loopback

When the digital loopback is selected, the transmit clock TxClk_n and transmit data inputs (TxPOS_n & TxNEG_n) are looped back and output onto the RxClk_n, RxPOS_n and RxNEG_n pins as shown in Figure 30.

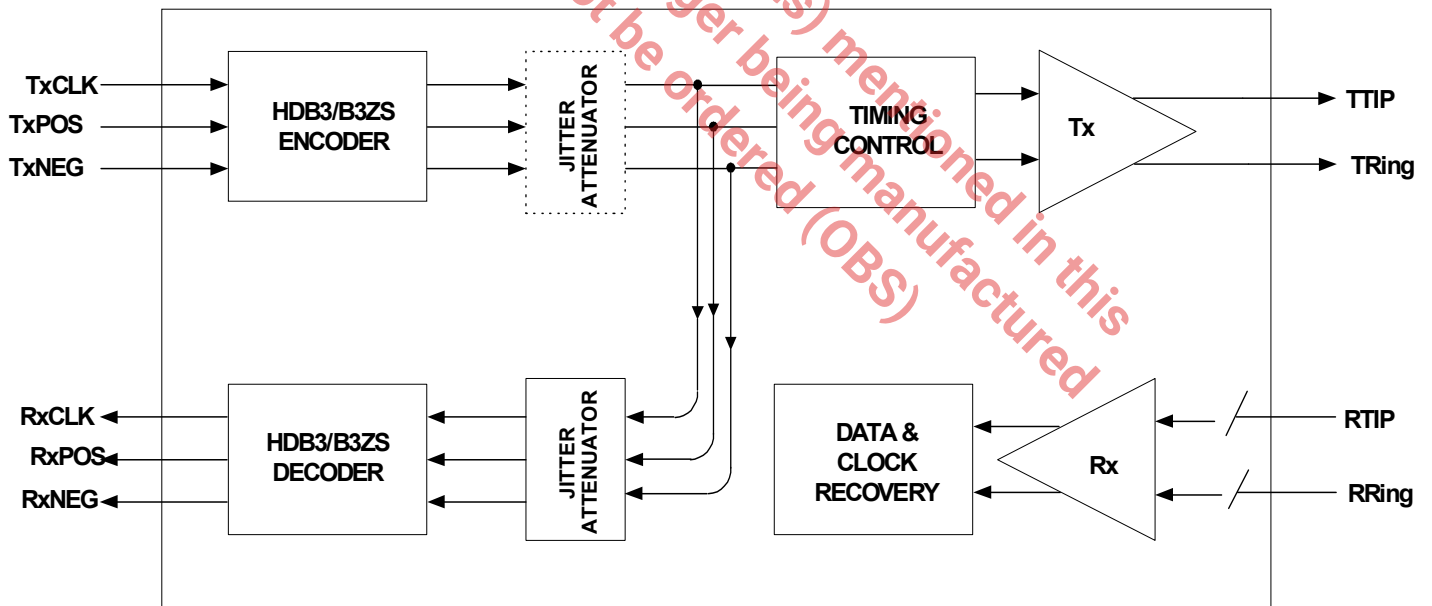

Figure 30: Digital Loopback

8.2.3 Remote Loopback

With remote loopback activated as shown in Figure 31, the receive data on RTIP and RRing is looped back after the jitter attenuator (if selected in the receive or transmit path) to the transmit path using RxClk as transmit timing. The receive data is also output via the RxPOS and RxNEG pins.

Note: Input signals on TxClk, TxPOS and TxNEG are ignored during remote loopback.

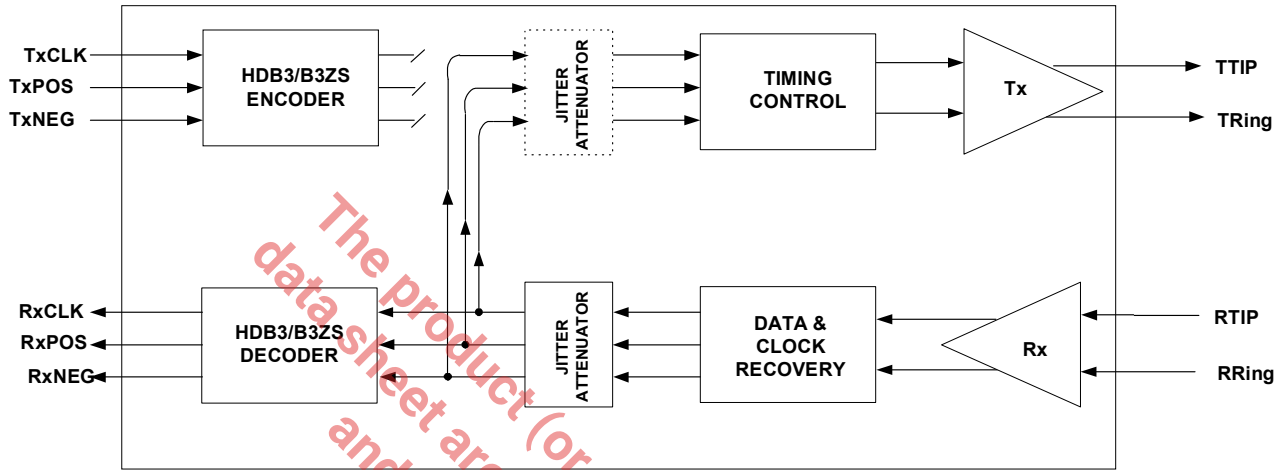

Figure 31: Remote Loopback

8.3 Transmit All Ones (TAOS)

Transmit All Ones (TAOS) can be selected by setting the TAOS_n control bits to “1” in the channel control registers. When the TAOS is set, the transmit section generates and transmits a continuous AMI all “1’s” pattern on the TTIP_n and TRing_n pins. The frequency of this ones pattern is determined by TxClk_n. The TAOS data path is shown in Figure 32. TAOS does not operate in Analog Loopback or Remote Loopback Modes, however will function in Digital Loopback Mode.

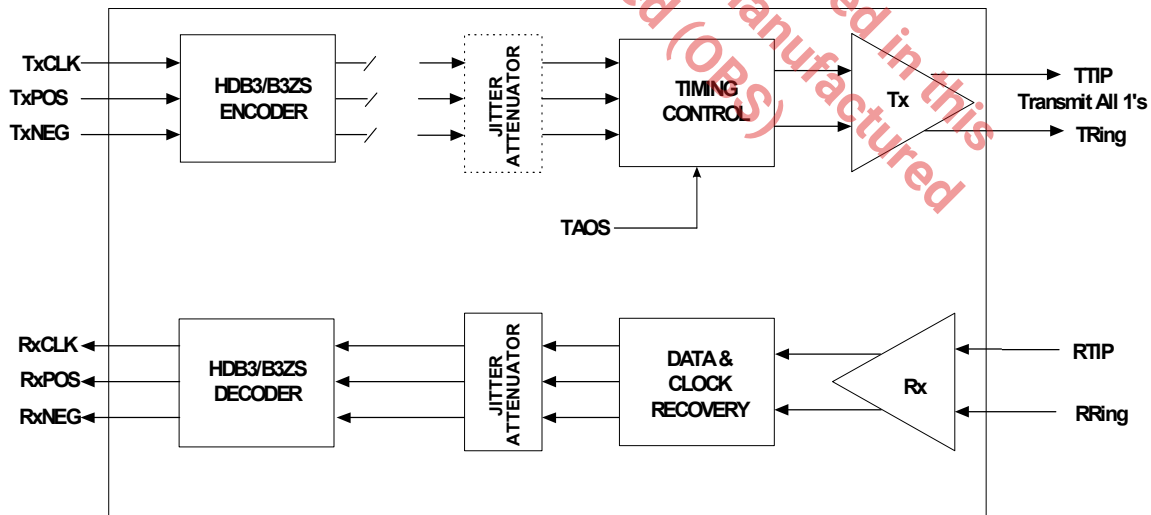

Figure 32: Transmit All Ones (TAOS)

9.0 Microprocessor Interface Block

The microprocessor interface section supports communication between the local microprocessor (μP) and the LIU. The XRT75R12 supports a parallel interface asynchronously or synchronously timed to the LIU. The microprocessor interface is selected by the state of the Pmode input pin. Selecting the microprocessor interface mode is shown in Table 23.

Table 23: Selecting the Microprocessor Interface Mode

Pmode	Microprocessor Mode
"Low"	Asynchronous mode
"High"	Synchronous mode

The local μP configures the LIU by writing data into specific addressable, on-chip read and write registers. The μP provides the signals which are required for a general purpose microprocessor to read or write data into these registers. The μP also supports polled and interrupt driven environments. A simplified block diagram of the microprocessor interface is shown in Figure 33.

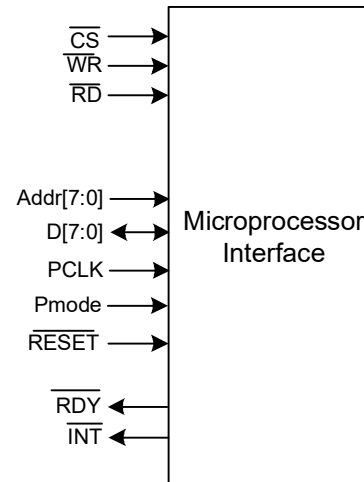

Figure 33: Simplified Block Diagram, Microprocessor Interface

9.1 Microprocessor Interface Signals

The LIU may be configured into different operating modes and have its performance monitored by software through a standard microprocessor using data, address, and control signals. These interface signals are described below in Table 24. The microprocessor interface can be configured to operate in Asynchronous Mode or Synchronous Mode.

Table 24: XRT75R12 Microprocessor Interface Signals

Pin Name	Type	Description	
Pmode	Mode select input pin	I	This pin is used to specify the microprocessor interface mode.
D[7:0]	Bi-Directional data bus	I/O	For register "read" or "write" operations.
Addr[7:0]	Eight-bit address bus inputs	I	The XRT75R12 LIU microprocessor interface uses a direct address bus. This address bus is provided to permit the user to select an on-chip register for read and write access.
$\overline{\text{CS}}$	Chip select input	I	This active low signal selects the microprocessor interface of the XRT75R12 LIU and enables read and write operations with the on-chip register locations.
$\overline{\text{RD}}$	Read signal	I	This active low input functions as the read signal from the local μP . When this pin is pulled "Low" (if $\overline{\text{CS}}$ is "Low"), the LIU is informed that a read operation has been requested and begins the process of the read cycle.
$\overline{\text{WR}}$	Write signal	I	This active low input functions as the write signal from the local μP . When this pin is pulled "Low" (if $\overline{\text{CS}}$ is "Low"), the LIU is informed that a write operation has been requested and begins the process of the write cycle.
$\overline{\text{RDY}}$	Ready output	O	This active low signal is provided by the LIU device. It indicates that the current read or write cycle is complete, and the LIU is waiting for the next command.
$\overline{\text{INT}}$	Interrupt output	O	This active low signal is provided by the LIU to alert the local μP that a change in alarm status has occurred. This pin is Reset Upon Read (RUR) once the alarm status registers have been cleared.
$\overline{\text{RESET}}$	Reset input	I	This active low input pin is used to Reset the LIU.

9.2 Asynchronous and Synchronous Description

Whether the LIU is configured for Asynchronous or Synchronous Mode, the following descriptions apply. The Synchronous Mode requires an input clock (PCLK) to be used as the microprocessor timing reference. Read and write operations are described below.

Read Cycle (For Pmode = "0" or "1")

Whenever the local μP wishes to read the contents of a register, it should do the following:

1. Place the address of the target register on the address bus input pins Addr[7:0].
2. While the μP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{\text{CS}}$ pin of the LIU, by toggling it "Low". This action enables communication between the μP and the LIU microprocessor interface block.
3. Next, the μP should indicate that this current bus cycle is a read operation by toggling the $\overline{\text{RD}}$ input pin "Low". This action enables the bi-directional data bus output drivers of the LIU.
4. After the μP toggles the read signal "Low", the LIU will toggle the $\overline{\text{RDY}}$ output pin "Low". The LIU does this to inform the μP that the data is available to be read by the μP , and that it is ready for the next command.
5. After the μP detects the $\overline{\text{RDY}}$ signal and has read the data, it can terminate the read cycle by toggling the $\overline{\text{RD}}$ input pin "High".
6. The $\overline{\text{CS}}$ input pin must be pulled "High" before a new command can be issued.

Write Cycle (For Pmode = "0" or "1")

Whenever a local μP wishes to write a byte or word of data into a register within the LIU, it should do the following:

1. Place the address of the target register on the address bus input pins Addr[7:0].
2. While the μP is placing this address value on the address bus, the address decoding circuitry should assert the $\overline{\text{CS}}$ pin of the LIU, by toggling it "Low". This action enables communication between the μP and the LIU microprocessor interface block.
3. The μP should then place the byte or word that it intends to write into the target register, on the bi-directional data bus D[7:0].
4. Next, the μP should indicate that this current bus cycle is a write operation by toggling the $\overline{\text{WR}}$ input pin "Low". This action enables the bi-directional data bus input drivers of the LIU.
5. After the μP toggles the write signal "Low", the LIU will toggle the $\overline{\text{RDY}}$ output pin "Low". The LIU does this to inform the μP that the data has been written into the internal register location, and that it is ready for the next command.
6. The $\overline{\text{CS}}$ input pin must be pulled "High" before a new command can be issued.

Figure 34: Asynchronous μP Interface Signals During Programmed I/O Read and Write Operations

Table 25: Asynchronous Timing Specifications

Symbol	Parameter	Min	Max	Units
t_0	Valid address to \overline{CS} falling edge	0	-	ns
t_1	\overline{CS} falling edge to \overline{RD} assert	0	-	ns
t_2	\overline{RD} assert to \overline{RDY} assert	-	65	ns
NA	\overline{RD} pulse width (t_2)	70	-	ns
t_3	\overline{CS} falling edge to \overline{WR} assert	0	-	ns

9.4 Global Chip-Level Registers

The register set within the XRT75R12 contains ten global or chip-level registers. These registers control operations in more than one channel or apply to the complete chip. This section will present detailed information on the global registers.

Table 28: Global Register List and Address Locations

Address	Command Register	Label	Type	Register Name

6	Loss of PRBS Pattern Lock	R/O	<p>Loss of PRBS Pattern Lock Indicator: This read-only bit-field indicates whether or not the PRBS receiver (within the receive section of channel n) is declaring PRBS Lock within the incoming PRBS pattern. If the PRBS receiver detects a very large number of bit-errors within its incoming data stream, then it will declare the Loss of PRBS Lock condition. Conversely, if the PRBS receiver were to detect its pre-determined PRBS pattern with the incoming DS3, E3 or STS-1 data stream, (with little or no bit errors) then the PRBS receiver will clear the Loss of PRBS Lock condition.</p> <ul style="list-style-type: none"> ■ 0 - Indicates that the PRBS receiver is currently declaring the PRBS Lock condition within the incoming DS3, E3 or STS-1 data stream. ■ 1 - Indicates that the PRBS receiver is currently declaring the Loss of PRBS Lock condition within the incoming DS3, E3 or STS-1 data stream. <p>Note: This register bit is only valid if all of the following are true:</p> <ol style="list-style-type: none"> a. The PRBS generator block (within the transmit section of the chip) is enabled. b. The PRBS receiver is enabled. c. The PRBS pattern (that is generated by the PRBS generator) is somehow looped back into the receive path (via the line-side), and in turn routed to the receive input of the PRBS receiver.
5	Digital LOS Defect Declared	R/O	<p>Digital LOS Defect Declared: This read-only bit-field indicates whether or not the digital LOS (Loss of Signal) detector is declaring the LOS defect condition. For DS3 and STS-1 applications, the digital LOS detector will declare the LOS defect condition whenever it detects an absence of pulses (within the incoming DS3 or STS-1 data stream) for 160 consecutive bit-periods. Further, (again for DS3 and STS-1 applications) the digital LOS detector will clear the LOS defect condition whenever it determines that the pulse density (within the incoming DS3 or STS-1 signal) is at least 33%.</p> <ul style="list-style-type: none"> ■ 0 - Indicates that the digital LOS detector is NOT declaring the LOS defect condition. ■ 1 - Indicates that the digital LOS detector is currently declaring the LOS defect condition. <p>Notes:</p> <ol style="list-style-type: none"> 1. LOS detection (within each channel of the XRT75R12) is performed by both an analog LOS detector and a digital LOS detector. The LOS state of a given channel is simply a wired-OR of the LOS defect declared states of these two detectors. 2. The current LOS defect condition (for the channel) can be determined by reading out the contents of bit 1 (receive LOS defect declared) within this register.

Table 44: (Continued) Alarm Status Registers (AS_n) - Channel n Address Location = 0xm3 (n=[0:11] & m= 0-5, 8-D)

Bit Number	Name	Type	Description
4	Analog LOS Defect Declared	R/O	<p>Analog LOS Defect Declared: This read-only bit-field indicates whether or not the analog LOS (Loss of Signal) detector is declaring the LOS defect condition. For DS3 and STS-1 applications, the analog LOS detector will declare the LOS defect condition whenever it determines that the amplitude of the pulses (within the incoming DS3 or STS-1 line signal) drops below a certain analog LOS defect declaration threshold level. Conversely, (again for DS3 and STS-1 applications) the analog LOS Detector will clear the LOS defect condition whenever it determines that the amplitude of the pulses (within the incoming DS3 or STS-1 line signal) has risen above a certain analog LOS defect clearance threshold level. It should be noted that, in order to prevent "chattering" within the analog LOS detector output, there is some built-in hysteresis between the analog LOS defect declaration and the analog LOS defect clearance threshold levels.</p> <ul style="list-style-type: none"> ■ 0 - Indicates that the analog LOS detector is NOT declaring the LOS defect condition. ■ 1 - Indicates that the analog LOS Detector is currently declaring the LOS defect condition. <p>Notes:</p> <ol style="list-style-type: none"> 1. LOS detection (within each channel of the XRT75R12) is performed by both an analog LOS detector and a digital LOS detector. The LOS state of a given channel is simply a wired-OR of the LOS defect declared states of these two detectors. 2. The current LOS defect condition (for the channel) can be determined by reading out the contents of bit 1 (receive LOS defect declared) within this register.
3	FL Alarm Declared	R/O	<p>FL (FIFO Limit) Alarm Declared: This read-only bit-field indicates whether or not the jitter attenuator block (within channel_n) is currently declaring the FIFO Limit Alarm. The jitter attenuator block will declare the FIFO Limit Alarm anytime the jitter attenuator FIFO comes within two bit-periods of either overflowing or under-running. Conversely, the jitter attenuator block will clear the FIFO Limit Alarm anytime the jitter attenuator FIFO is no longer within two bit-periods of either overflowing or under-running. Typically, this alarm will only be declared whenever there is a very serious problem with timing or jitter in the system.</p> <ul style="list-style-type: none"> ■ 0 - Indicates that the jitter attenuator block (within channel_n) is NOT currently declaring the FIFO Limit Alarm condition. ■ 1 - Indicates that the Jitter Attenuator block (within channel_n) is currently declaring the FIFO Limit Alarm condition. <p>Note: This bit-field is only active if the jitter attenuator (within channel_n) has been enabled.</p>

Bit Number	Name	Type	Description
2	Receive LOL Condition Declared	R/O	<p>Receive LOL (Loss of Lock) Condition Declared: This read-only bit-field indicates whether or not the receive section (within channel_n) is currently declaring the LOL (Loss of Lock) condition. The receive section (of channel_n) will declare the LOL condition, if the frequency of the recovered clock signal differs from that of the reference clock programmed for that channel (from the appropriate oscillator or the SFM clock synthesizer, if in that mode) by 0.5% (or 5000ppm) or more.</p> <ul style="list-style-type: none"> ▪ 0 - Indicates that the receive section of channel_n is NOT currently declaring the LOL condition. ▪ 1 - Indicates that the receive section of channel_n is currently declaring the LOL condition and the recovered clock differs by more than 0.5%.
1	Receive LOS Defect Condition Declared	R/O	<p>Receive LOS (Loss of Signal) Defect Condition Declared: This read-only bit-field indicates whether or not the receive section (within channel_n) is currently declaring the LOS defect condition. The receive section (of channel_n) will declare the LOS defect condition, if any one of the following conditions is met:</p> <ul style="list-style-type: none"> ▪ If the digital LOS detector declares the LOS defect condition (for DS3 or STS-1 applications) ▪ If the analog LOS detector declares the LOS defect condition (for DS3 or STS-1 applications) ▪ If the ITU-T G.775 LOS detector declares the LOS defect condition (for E3 applications). <p>0 - Indicates that the receive section of channel_n is NOT currently declaring the LOS defect condition. 1 - Indicates that the receive section of channel_n is currently declaring the LOS defect condition.</p>
0	Transmit DMO Condition Declared	R/O	<p>Transmit DMO (Drive Monitor Output) Condition Declared: This read-only bit-field indicates whether or not the transmit section of channel_n is currently declaring the DMO alarm condition. As configured, the transmit section will either internally (via the TTIP_n and TRING_n) or externally (via the MTIP_n and MRING_n) check the transmit output DS3, E3, or STS-1 line signal for bipolar pulses. If the transmit section were to detect no bipolar for 128 consecutive bit-periods, then it will declare the transmit DMO alarm condition. This particular alarm can be used to check for fault conditions on the transmit output line signal path. The transmit section will clear the transmit DMO alarm condition upon detecting bipolar activity on the transmit output line signal.</p> <ul style="list-style-type: none"> ▪ 0 - Indicates that the transmit section of channel_n is NOT currently declaring the transmit DMO alarm condition. ▪ 1 - Indicates that the transmit section of channel_n is currently declaring the transmit DMO alarm condition.

Each channel contains a dedicated 16 bit PRBS error counter. When enabled, this counter will accumulate PRBS errors (as well as excess zeros and LCVs). The LS byte will "carry" a one over to the MS byte each time it rolls over from 255 to zero until the MS byte also reaches 255. When both counters reach 255, no further errors will be accumulated and "all ones" will signify an overflow condition.

The counter can be read while in the active count mode. Either register may be read "on the fly" and the other byte will be simultaneously transferred into the channel's Error Holding Register. The holding register may then be read to supply the host with a correct 16 bit count (as of the instant of reading). With this mechanism, the host could rapidly cycle through reading all twelve counters in order (storing the read byte in scratch RAM) and then come back and read the second byte from each holding register to form the 16 bit accumulation in the host system.

10.0 Specifications

10.1 Absolute Maximum Ratings

Table 59: Absolute Maximum Ratings

Symbol	Parameter	Minimum	Maximum	Units	Comments
V_{DD}	Supply voltage ⁽¹⁾	-0.5	6.0	V	
V_{IN}	Input voltage at any pin ⁽¹⁾	-0.5	5.5	V	
I_{IN}	Input current at any pin ⁽¹⁾		100	mA	
S_{TEMP}	Storage temperature ⁽¹⁾	-65	150	°C	
A_{TEMP}	Ambient operating temperature	-40	85	°C	Industrial temperature grade
Θ_{JA}	Thermal resistance: junction-to-ambient ⁽³⁾		7.5	°C/W	Linear air flow 200ft per minute
Θ_{JC}	Thermal resistance: junction-to-case		0.5	°C/W	All conditions
M_{LEVL}	Exposure to moisture	5		level	EIA / JEDEC JESD22-A112-A
ESD	ESD rating ⁽²⁾	2000		V	

1. Exposure to or operating near the minimum or maximum values for extended period may cause permanent failure and impair reliability of the device.
2. ESD testing method is per MIL-STD-883D,M-3015.7.
3. Linear air flow of 200 ft per minute recommended for industrial applications. $\Theta_{JA} = 9.4^{\circ}\text{C/W}$ with 0Lft per minute, $\Theta_{JA} = 7.1^{\circ}\text{C/W}$ with 400Lft per minute.

10.2 DC Electrical Characteristics

Table 60: DC Electrical Characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Units
V_{DD}	Digital supply voltage	3.135	3.3	3.465	V
V_{DD}	Analog supply voltage	3.135	3.3	3.465	V
I_{CC_DS3}	DS3 current consumption using PRBS 2 ²³ -1 pattern ⁽³⁾		1016	1117	mA
I_{CC_DS3JA}	DS3 current consumption using PRBS 2 ²³ -1 pattern ⁽⁴⁾		1172	1290	mA
I_{CC_E3}	E3 current consumption using PRBS 2 ²³ -1 pattern ⁽³⁾		1040	1140	mA
I_{CC_E3JA}	E3 current consumption using PRBS 2 ²³ -1 pattern ⁽⁴⁾		1180	1300	mA
I_{CC_STS1}	STS1 current consumption using PRBS 2 ²³ -1 pattern ⁽³⁾		1100	1210	mA
I_{CC_STS1JA}	STS1 current consumption using PRBS 2 ²³ -1 pattern ⁽⁴⁾		1300	1430	mA
P_{CC_DS3}	DS3 power consumption ⁽⁵⁾		3.35	3.87	W
P_{CC_DS3JA}	DS3 power consumption with jitter attenuator enabled ⁽⁵⁾		3.87	4.47	W
P_{CC_E3}	E3 power consumption ⁽⁵⁾		3.43	3.95	W
P_{CC_E3JA}	E3 power consumption with jitter attenuator enabled ⁽⁵⁾		3.89	4.50	W
P_{CC_STS1}	STS1 power consumption ⁽⁵⁾		3.63	4.19	W
P_{CC_STS1JA}	STS1 power consumption with jitter attenuator enabled ⁽⁵⁾		4.29	4.95	W
V_{IL}	Input low voltage ⁽²⁾			0.8	V
V_{IH}	Input high voltage ⁽²⁾	2.0		5.5	V
V_{OL}	Output low voltage, $I_{OUT} = -4\text{mA}$			0.4	V
V_{OH}	Output high voltage, $I_{OUT} = 4\text{mA}$	2.4			V
I_L	Input leakage current ⁽¹⁾			±10	μA
C_I	Input capacitance			10	pF
C_L	Load capacitance			10	pF

1. Not applicable for pins with pull-up or pull-down resistors.

2. The digital inputs are TTL 5V compliant.

3. With jitter attenuator disabled.

4. With jitter attenuator enabled.

5. These values are **not** a measure of power dissipation. These values represent the total power consumption. For example:

$$P_{CC} \text{ Consumption} = P_{DD} \text{ Dissipation} + P_{LD} \text{ Delivered to Load}$$

11.0 Mechanical Dimensions

11.1 TBGA420

- ALL DIMENSIONS ARE IN MILLIMETERS, ANGLES ARE IN DEGREES.
- DIMENSIONS AND TOLERANCE PER JEDEC MD-318.

Drawing No.: POD-000000 153

Revision: A

Figure 36: Mechanical Dimensions, TBGA420

12.0 Ordering Information

Table 61: Ordering Information⁽¹⁾

Ordering Part Number	Operating Temperature Range	Package	Packaging Method	Lead-Free
XRT75R12IB-L	-40°C to 85°C	TBGA420	Tray	Yes ⁽²⁾

1. Refer to www.maxlinear.com/XRT75R12 for most up-to-date Ordering Information.
